Tel: (018)299-1111/2222
Fax: (018)299-2799
Internet: http://www.nwu.ac.za

PLEASE MENTION YOUR UNIVERSITY NUMBER IN ALL CORRESPONDENCE.

The General Academic Rules of the University, to which all students have to subject themselves and which apply to all the qualifications offered by the University, appear in a separate publication and are available on the web page at: http://www.puk.ac.za/haarboek/index_e.html.

Please note: Although the information in this Calendar has been compiled with the utmost care and accuracy, the Council and the Senate of the University accept no responsibility whatsoever for errors that may occur. Before students finally decide on the selection of modules, they must consult the class timetable. If a clash occurs in the planned selection of a student, the relevant module combination is not permitted.

Prof CA Strydom, PrSciNat, PhD (UP)

School of Computer, Statistical and Mathematical Sciences
Prof GJ Groenewald, HonsBSc (UWC), MSc (Univ. of Illinois at Urbana-Champaign), MSc (UK), PhD (Vrije Univ. Amsterdam).
I.1 INTRODUCTION

I.1.1 THE FACULTY

The Faculty of Engineering of the NW University officially came into existence in 1982. In 1992 the Faculty relocated from the Vaal Triangle to Potchefstroom. The Faculty comprises four schools offering training, teaching, post-graduate study and research in seven specialised fields in Engineering.

Vision

The Faculty of Engineering's vision is to be the Faculty of choice in Southern Africa.

Mission

The Faculty of Engineering's mission is to be a balanced learning and research faculty which is relevant for the development of students, the community and the industry.

The Faculty will achieve its mission by:

- Being locally involved, nationally relevant and internationally competitive;
- Fostering scientific innovation and entrepreneurial thinking among students and staff;
- Focusing on the general shaping of students in respect of their career outcomes;
- Delivering high quality engineers with skills that emphasise the implementation of engineering principles in the industry, and
- Developing new knowledge through research, assisting the advancement of the country and its people.

The Faculty offers research opportunities to promising persons who wish to pursue a research career after completion of the Bachelor's degree (BEng) and are interested in postgraduate study towards a masters' degree (MEng) and/or the doctorate (PhD) in Engineering. In the Faculty of Engineering there are research centres of excellence, enjoying support from industry and statutory bodies. The Faculty may also award the higher doctorate (DEng) for outstanding research conducted without direct supervision.

For information regarding postgraduate study, you are referred to the Postgraduate Calendar.

I.1.2 THE ENGINEERING PROFESSION

I.1.2.1 The Role of the Professional Engineer

Engineering refers to the practice of the organising of the design, construction and operation of artefacts (products, processes or systems) which transform the physical world around us, in order to satisfy certain identified needs. Engineers study science and use it to solve problems of practical importance, typically by a process known as creative synthesis or design. Engineers are members of a profession and are responsible for the discerning application of their knowledge with a view to the sustainable economic progress and welfare of humanity.
Although engineering as a profession has its origin in the earliest development of humankind, it was only in the middle of the nineteenth century that scientific methodology was first systematically applied to solve engineering problems and when a start was made with the establishment of engineering schools, leading to engineering being recognized as a “learned profession”.

With the impact of technology on our society engineering plays an increasingly important role with respect to economic development. Excellent work opportunities exist for engineers in almost all sectors of the economy, both locally and overseas.

The purpose of the BEng degree is to equip students with the necessary knowledge to be able to practise as professional engineers.

I.1.2.2 Professional ethics

Engineers are subject to a professional code of conduct. The Engineering Council of South Africa (ECSA) is vested with powers to lay down standards for education and to register qualified persons as professional engineers. Registration as a Professional Engineer (PrEng) certifies that a person is authorised to practise as an engineer. ECSA also has the authority to take disciplinary action against engineers who are guilty of misconduct.

Due to the high ethical standards in the engineering profession it is improbable that a person who has been convicted and sentenced in a court of law or against whom disciplinary measures have been taken as a result of conduct which suggests dishonesty, will be admitted to the engineering profession, notwithstanding good academic results.

More information regarding the engineering profession is available on the website of the Engineering Council of South Africa at http://www.ecsa.co.za/.

I.1.2.3 Registration as Professional Engineer

To register as a professional engineer, and so use the title PrEng, a person must normally meet two requirements:

- The person must hold a BEng or BScEng degree that has been accredited by ECSA for this purpose; and
- The person must have completed a period of in-service training that satisfies ECSA’s requirements in terms of standard and duration (at least three years). This period may be shortened with one year after obtaining an advanced university degree.

I.1.3 PROFESSIONAL STATUS

I.1.3.1 ECSA Accreditation

The BEng programmes of the Faculty are formulated to meet the requirements of the Engineering Council of South Africa (ECSA) for accredited BEng programmes. This means that each of the programmes includes at least the required number of credits per ECSA knowledge area, and also develops and assesses all the ECSA exit-level outcomes. Each student who has completed a BEng programme, meets the ECSA requirements.

The bachelors’ degree awarded in the Faculty of Engineering is recognized by:

- The Engineering Council of South Africa (ECSA) as a qualifying degree for registration as professional engineer (PrEng) in terms of the Engineering Profession Act (Act no 46 of 2000).
• The following Engineering societies for membership:
  SA Institute of Chemical Engineering (SACHI)
  SA Institute of Electrical Engineering (SAIChE)
  SA Institute of Mechanical Engineering (SAIMI)
  SA Institute of Mining and Metallurgy (SAIMM)

• Other local universities and universities abroad for advanced postgraduate study.

I.1.3.2 International Comparability

International comparability of this whole qualification standard is ensured through the Washington Accord, an agreement for the mutual recognition of professionally-oriented bachelor's degrees in engineering. The standards are comparable with the Washington Accord Graduate Attributes. Washington Accord signatories are: Australia, Canada, Chinese Taipei, Hong Kong China, India, Ireland, Japan, Republic of Korea, Malaysia, Russia, New Zealand, Singapore, South Africa, Sri Lanka, Turkey, United Kingdom, and the United States of America. Comparability is audited on a six-yearly cycle by a visiting Washington Accord team.

List as at July 2014. The current signatories and the Graduate Attributes can be found on http://www.ieagreements.org.

I.1.4 AUTHORITY OF THE GENERAL RULES

The Faculty Rules valid for the different qualifications, programmes and curricula of this faculty and contained in this faculty calendar are subject to the General Rules of the University, as determined from time to time by the Council of the University on recommendation of the Senate. The faculty rules should, therefore, be read in conjunction with the General Rules. See http://www.puk.ac.za/jaarboek/index.html

I.1.4.1 General provisions

In accordance with the General Academic Rules of the North-West University the following apply with regard to application and interpretation:

These rules must be read with and applied subject to the Higher Education Act, 1997 and the Statute of the North-West University and in conjunction with policies as determined by Senate and Council, such as, but not limited to, the Admission Policy, the Recognition of Prior Learning Policy and the Assessment and Moderation Policy, as well as the schedule of payable fees as determined annually by the University.

Senate must compile a manual for post-graduate studies within the framework of the provisions of these Rules, which manual has the status of a binding policy document of the University, in order to regulate matters relating to the preparation for, progress, guidance and completion of post-graduate studies.

Except where expressly provided for otherwise, these Rules apply to all qualification programmes listed in the Programme and Qualification Mix of the North-West University and offered by the University and prevail over faculty rules.

In instances where a faculty rule may contain provisions that are in conflict with these rules, the latter will prevail.
Where functions and decision-making authority are entrusted by these Rules to persons or structures, Senate or the campus senate committee concerned may at any time resolve to require the person or structure concerned to report on the performance of the relevant function or the making of the decision, and Senate or the campus senate committee concerned may, within the limits of reasonableness taking into account the implications for those affected thereby, replace or revoke the act or decision concerned. (General Rules 1.1).

I.1.5 EVALUATION OF ACADEMIC LITERACY

In order to evaluate their ability to function in an academic environment, all undergraduate students who register at the University for the first time must report for a compulsory skills test in academic literacy, at a time and place determined by the University. The purpose of this test is to identify students who, due to inadequate academic skills, may fail to complete their study programme within the stipulated period, (A.5.2).

Students have the option of writing the compulsory skills test in English or Afrikaans. With the exception of students who are identified as borderline cases by the test, each student has only one opportunity to write the test. Students, who are regarded as borderline cases, will be granted a second opportunity to write the test. It is the student’s responsibility to establish his/her result within 14 days of writing the test and to register for the correct module and in the correct semester.

Students who are regarded as at-risk cases must register for the module AGLA111 [Afrikaans] or AGLE111 [English], depending on the language in which the compulsory skills test was written. These modules are not calculated in terms of curriculum credits, but the credits earned in this way are regarded as additional credits.

Admission to the examination for AGLA111/AGLE111 requires a participation mark of 35%. Students who are not admitted to the examination for AGLA111/AGLE111 or who fail the relevant examination as well as two or more other modules, will have to be re-evaluated by the Evaluation Committee if they want to continue their studies in the following semester. In order to avoid the termination of studies, AGLA111/AGLE111 must be completed at the end of the student's second historic year, at the very latest. *AGLA/E121 consists of three papers, viz. Academic Literacy, Computer and Information Skills and Reading Skills. There is a subminimum in each of the three components. The student must pass each of the three components in the same semester in which he/she has registered for the module in order to pass the module.

*Engineering programmes include the compulsory module FIAP172 (24 credits), which includes the outcomes of AGLA121/AGLE121. Engineering students who failed the module AGLA111/AGLE111, but passed FIAP172, may have the result of AGLA111/AGLE111 conditionally condoned by the relevant School Director to allow for a pass mark in the module. A module mark of at least 40% for AGLA111/AGLE111 must have been obtained and this permission is only valid if FIAP172 is passed in the same year.

Admission to the module AGLA121/AGLE121, which is compulsory for all students who register at the University for the first time, requires that a student should first complete AGLA111/AGLE111 and must obtain a mark of at least 40% for AGLA111/AGLE111. The module AGLA121 / AGLE121 carries a value
of 12 credits, forming part of the curriculum for which the student has registered, and must be taken in the language in which the compulsory skills test and AGLA111/AGLE111 were taken.

Students who failed the module AGLA111/AGLE111, but were allowed to continue with AGLA121/AGLE121 and who passed the examination in this module, may have the result of AGLA111 / AGLE111 condoned by the relevant School Director to allow for a pass mark in the module.

Students who have already successfully completed a module(s)/course(s) equivalent to AGLA111 and 121/AGLE111 and 121 at another institution and can provide proof in this regard, may apply in writing to the Head of the Centre for Academic and Professional Language Practice for formal recognition.

I.1.6 WARNING AGAINST PLAGIARISM:
Assignments are individual tasks and not group activities (unless explicitly indicated as group activities). For further details see: http://www.puk.ac.za/beheer-bestuur/beleid-reels/index_e.html

I.1.7 CAPACITY STIPULATION
Please take cognizance of the fact that, owing to specific capacity constraints, the University reserves the right to select candidates for admission to certain fields of study. This means that prospective students who comply with the minimum requirements may not necessarily be admitted to the relevant course.

I.1.8 ADMISSION REQUIREMENTS FOR THE QUALIFICATION
I.1.8.1 General
For admission to BEng degree studies the following apply:

Full matriculation exemption, with an APS count of at least 31, Mathematics level 6 (70-79%) and Physical Sciences level 5 (60-69%). Consult http://www.puk.ac.za/vstudente/index_e.html for the requirements for undergraduate studies and the calculation of the APS score.

The Language requirement is a pass at level 5 (60-69%) in the language of instruction on either the Home or First Additional Language level.

This, together with the compulsory Engineering Test, will be part of the selection process.

The number of students allowed into a school may be restricted.

I.1.8.2 Engineering test
Prospective first year applicants for any engineering programme, who comply with the minimum requirements as given above, must write an engineering admission test. June matric results are requires for the compulsory test.

a) Prospective students who do comply with the minimum admission requirements, with a APS score of 40, an average percentage of 80%, Mathematics 90% and Physical Sciences 80% will be accepted unconditionally. They write the test before registration.
b) Prospective students who do comply with the minimum admission requirements, with an average percentage of 65% or more, will be invited to write the engineering admission test.

c) Prospective students who do comply with the requirement of a APS count of 31, with an average percentage of less than 65%, will be on a waiting list.

d) Prospective students who do not comply with the requirement of the APS count, will not be considered for admission.

Enquiries: Ms Elza Hattingh
Project manager: Engineering
Elza.hattingh@nwu.ac.za
(018) 299 4026

I.1.8.3  Admission requirements: application switching from BSc to BEng

Prospective students who do not comply with the admission requirements for BEng programmes offered by the Faculty, register on year level 1 of a BSc programme in the Faculty of Natural Sciences.

At the end of his/her first year a new application for admission to a programme offered by the Faculty of Engineering can be submitted. Admission is subject to performance and the requirement that all the first year modules must be passed. An engineering admission test must also be passed.

By virtue of General Rule 2.3.2.3 a student who desires to change to another curriculum has to apply, in writing, to the relevant Faculty for recognition of modules already passed and which form part of the curriculum to which he/she wants to change.

I.1.8.4  Joining from another university

a) Students who started their studies in Engineering at another university and who are desirous to continue their studies at this University, are strongly advised to complete only the first year level of the programme at that university before applying to continue with the second level programme at this University.

b) Applications from students who started their engineering studies at another university and who wish to continue at this university, will only be considered if the first year of study has been completed successfully at the previous university. An application to continue with the second year of the BEng programmes at this university, will be considered.

c) Students who studied Engineering at another university are subject to selection. Their applications for admittance to one of the BEng programmes will be treated on an ad hoc basis.

d) Students who studied Engineering at another university and who were not allowed to continue at that university, will not be allowed to register for any BEng programme at NWU.

e) Applications for admission to one of the BEng programmes for a particular year, close on 31 July of the previous year and application for acceptances of modules on the grounds of corresponding modules passed at another university, must be directed to the Dean before the beginning of the academic year.
f) Students who started their studies in Engineering at another university and who are desirous to continue their studies at this University must, at the start of their study at the other university, already have complied with the admission requirements of the Faculty of Engineering of the NWU.

Technicon diplomats seeking admission to the Faculty must contact the Admissions Office. Every application will be judged on merit and previous learning will be taken into consideration.

Enquiries:
Admissions Office
Building F20
(018) 299 2624

I.1.9 RECOGNITION OF PRIOR LEARNING
The requirements regarding prior learning are stipulated in General Rules 2.3.2.3.

I.1.10 AMENDMENT OF CURRICULUM AND/OR QUALIFICATION
Converting from one curriculum to another (including amendment of qualification or programme) is by way of a student request form. The full transcript of the student along with the maximum period of the study, are hereby considered. Admission is subject to the approval of the Dean.

I.1.11 REGISTRATION
The following General Rules for registration, apply:

A student may not be registered simultaneously at the University and at another higher education institution without written permission granted by the campus registrar concerned on recommendation of the dean concerned and with the concurrence of the other institution, (1.3.2).

A student may not be registered simultaneously for more than one qualification within the University without prior written permission granted by the campus registrar concerned on recommendation by the dean or deans concerned, (1.3.3).

Subject to specific exceptions granted by the campus registrar concerned, only registered students are entitled to utilize the University's facilities, (1.3.4).

By signing and submitting the application and registration forms either on paper or electronically a student agrees to be bound by all rules, policies and decisions of the University for the duration of the student's study at the University, (1.3.5).

A student who is admitted to and registered at the University continues to be a student of the University for the duration of the validity of the registration or until such time as the registration is validly terminated by the student or by the University, (1.3.6).

The University reserves the right to cancel any erroneous registration and to withdraw any qualification that was awarded erroneously after the conclusion of a disciplinary process or the completion of a thorough administrative enquiry, (1.3.7).
I.11.1  Annual registration

The following apply for annual registration (General Rules 2.3.1):

A student who has been admitted to the University registers for a specific qualification programme per annum or per semester for the duration of the study at the time determined in the annual calendar for that purpose, by paying the prescribed registration fee, completing the registration form either on paper or electronically, acquiring the required approval from faculty advisers and other functionaries concerned and submitting the form to the campus registrar concerned, upon which proof of registration is issued to the student, (2.3.1.1).

Students who attend lectures, write tests, submit assignments and who write examinations without officially being registered, receive no credits, even if the prescribed fees have been paid, (2.3.1.2).

A student registers on the date of registration in accordance with the rules relating to the qualification programme, curriculum and module concerned as provided for in faculty rules, (2.3.1.3).

Except where faculty rules provide otherwise, a student registered for a degree that leads to professional or statutory registration may only register for final year modules after all preceding modules have been passed (General Rule 2.3.3.4). Permission will be considered by way of a student request and is subject to the approval of the Dean.

It is the personal responsibility of the student to ensure that all requirements for registration for the qualification programme, curriculum and module are complied with and that no class, test or examination time table clashes between modules for which the student registers, will occur. The University reserves the right to refuse or cancel a registration where this condition is not met, (2.3.1.4).

A student may, in terms of the prescribed university procedures, change his/her registration within the period determined annually by the University.

I.11.2  Module acceptances and exemptions

I.11.3  General

A student who has studied at another recognised higher education institution and who applies to register in a qualification programme at the University, may apply in writing to the dean concerned for recognition or exemption of modules required for the qualification programme for which the student wishes to register, provided that the dean may grant recognition or exemption for no more than half the credits, preferably regarding the modules in the junior year levels of the qualification programme concerned, (2.3.2.1).

A student who has acquired a qualification from the University or any other recognized higher education institution and who applies for registration in a qualification programme at the University, may apply in writing to the dean concerned for recognition or exemption of modules required for the qualification programme for which the student wishes to register, provided that the dean may grant recognition or exemption for no more than half of the credits, preferably regarding the modules in the junior year levels of the qualification programme concerned, (2.3.2.2).

Any registered student who wishes to change to a different curriculum, may within the framework of the applicable faculty rules, apply in writing to the dean...
concerned for the recognition or exemption of modules already passed which are included in the curriculum to which the student wishes to change, (2.3.2.3).

I.1.11.4 Exemptions for a period and specific modules

Faculty rules may stipulate that recognition or exemption of modules will apply for a specific period or that the dean may grant exemption or recognition of only certain modules, (2.2.4).

For General Rule 2.3.2.4 the Faculty rule applies namely that recognition or exemption of modules will apply for five years. Applications for the recognition of only specific modules or exemption of modules longer than the prescribed period will be evaluated on merit by the Dean, in consultation with the School Director.

An undergraduate or diploma student who has written a module examination and has failed that module and has to repeat the module, may apply in writing to the dean concerned to be exempted in the year after the module was failed from the practical work in the module, in which case the student registers for the module and makes the necessary arrangements with the lecturer concerned for the transfer of the mark for practical work from the previous year in order to form part of the participation mark, (2.3.2.5).

A student who failed a module and has in the opinion of the relevant school director complied with the class attendance requirements in the previous year, may on the recommendation of the school director concerned be exempted once from class attendance in that module by the dean concerned, subject to conditions provided for in the faculty rules, (2.3.2.6).

I.1.11.5 Registration according to time-table

A student is not allowed to register for a module if, according to the standard time-table for lectures, tests and examinations, there is a schedule clash with respect to another module for which the student is registered.

If a module has to be repeated the relevant module has again to be taken and a participation mark built again. No exemption from class attendance will be given.

Before deciding finally on the choice of modules, students must take full cognizance of the class time-table. If the intended choice leads to a clash, the relevant choice is not allowed.

Such cases must be discussed with the relevant persons at the Faculty administration.

I.1.11.6 Simultaneous registration at more than one institution

A student may not be registered simultaneously at the University and at another higher education institution without written permission granted by the campus registrar concerned on recommendation of the dean concerned and with the concurrence of the other institution (General Rule 1.3.2).

I.1.11.7 Simultaneous registration for more than one qualification

A student may not be registered simultaneously for more than one qualification within the University without prior written permission granted by the campus registrar concerned on recommendation by the dean or deans concerned (General Rule 1.3.3);
i. a student's application for simultaneous registration for more than one qualification will be considered on merit if no more than two modules are outstanding before the first qualification can be obtained and other program requirements as well as requirements of Statutory Councils have been taken into account;

ii. no modules may have timetable clashes;

iii. the practical sessions of PGCE may not take precedence over the class attendance and practical sessions of modules of the first qualification; and

iv. a student must put in an official request; also, permission for simultaneous registration of two qualifications must be obtained from both faculties, where applicable.

I.1.11.8 Registration for additional modules

Apart from the required modules of the relevant curriculum, a student may take additional modules in terms of the provision in the General Rule 2.3.4.

A student who registers for the first year level of a curriculum may only be allowed to register additionally for one module on first year level per semester not required for the curriculum concerned, provided that no timetable clashes are brought about thereby.

A student who has already passed the first year of a curriculum may, with the permission of the dean concerned – which may be granted in accordance with the faculty rules - register for a maximum of two modules per semester or two year modules or one semester module and one year module, additional to the modules required for the curriculum, provided that no timetable clashes are brought about thereby and that the student passed all the modules of the previous semester.

A student who failed modules may in accordance with the faculty rules be allowed by the dean concerned to register for a maximum of two modules per semester or two year modules or one semester module and one year module, additional to the modules required for the curriculum, provided that no timetable clashes are brought about thereby.

Where a dean is satisfied that a particular student should be allowed to register for more modules than provided for in 2.3.4.1, 2.3.4.2 or 2.3.4.3 above, the specific decision is subject to the approval of the relevant faculty board.

I.1.12 EXAMINATION

I.1.12.1 Participation mark

The participation mark for a module is calculated from tests, assignments, practical work and research assignments. The ratio between theory and practica for the calculation of the participation mark is set out in the study guides of the various modules.

I.1.12.2 Number of examination opportunities

The number of examination opportunities are in accordance with General Rule 2.4.4.

For undergraduate examinations there are two examination opportunities per module, of which the student may utilise one or both.
A student who utilises the second examination opportunity will be liable for the prescribed fee.

Where the student utilises both opportunities, the module mark is calculated with reference to the participation mark which gave admission to the first examination opportunity and the mark achieved in the second examination.

Faculty rules may exclude specific modules from a second examination opportunity.

A student who, having used all ordinary examination opportunities, has passed all modules but one required for a qualification, may apply to the dean concerned to be granted a final assessment opportunity in the outstanding module, provided that the student was registered for that module in that academic year and had a participation mark that admitted him/her to the examination, (2.4.4.5).

The proof of participation the student achieved for a module for the first examination opportunity, is carried over to the second examination opportunity.

I.1.12.3 Medical certificates for absence

No medical certificate is required for missed examinations: students must avail themselves of the first and/or the second examination opportunity.

Regarding absence from a semester test due to illness a valid medical certificate, which attests to the student's inability to write the test, has to be handed in. This certificate has to be submitted to the school director within five working days of the consultation with the doctor, or the date of the test, whichever was first.

I.1.12.4 Use of pocket calculators during examinations

The following policy with respect to calculators has been approved:

a) Prescribed calculators may be used, but are not supplied centrally.

b) If the calculators in question cannot be described adequately, the examiner must be present in person in order to check the calculators.

c) The chief invigilator must, at the start of each examination session/test, direct the candidates' attention specifically to the requirement that only calculators indicated on the examination paper may be used.

d) No student may borrow a calculator from another student during an examination/test session.

e) Any deviation from these Regulations will constitute an infringement of the examination and test Regulations.

f) Regarding the use of non-standard calculators during examinations, the following applies:

g) In exceptional cases, permission for the use of non-standard calculators may be given. An application with motivation to this effect has to be handed in two weeks before the commencement of the examination. In each case measures must be taken to clear the memory of the calculator before it is taken into the examination hall. On each examination paper it must be stated whether a pocket calculator with memory may be used and, if so, that the memory must be cleared. The student and the
invigilator must ascertain this and they then have to sign a statement to this effect.

**I.1.12.5 Admission to examination**

The requirements regarding undergraduate examination are stipulated in General Rule 2.4.

A student who achieved the required participation mark or proof of participation prescribed by the faculty rules, is admitted to the examination in the module concerned.

"Proof of participation" is a confirmation by the lecturer in a specific module that a student participated satisfactorily in the teaching-learning activities and in the performance of teaching-learning assignments in accordance with the curriculum requirements, whereby the student is admitted to a final assessment in that module or part of that module.

In the Faculty of Engineering a minimum participation mark of 40% must be achieved for admission to the examination.

The participation mark for a module is made up of marks for tests, assignments and practical work. For each teaching-learning task (class tests, assignments, reports, etc.) executed by means of formative assessment in a module, a mark will be awarded. A student’s participation mark is the weighted average of these marks.

Admission to the examination in any module is obtained by the achievement of a proof of participation which will only be issued to a student if he/she

a) has fulfilled the specific requirements required for the relevant module as explained in the study guide;  

b) where applicable, has completed the practical work required for a module; and

c) has achieved a participation mark of at least 40%.

The relationship between theory and practical work for the calculation of the participation mark of a module is explained in the relevant study guide.

The proof of participation the student achieved for a module for the first examination opportunity, is carried over to the second examination opportunity.

**I.1.12.6 Relationship between credits, teaching periods and examination papers**

Modules are grouped according to their level of advancement, which may also be related to the year of study in which the modules are taken in a specific programme, if the programme is to be completed in the minimum study period.

The engineering curricula are put together with a view to the minimum period of four years (BEng degree). A Student may apply to spread the modules of a programme over a longer period. Extension of the maximum study time of a programme due to a lack of progression by the student, will only be allowed in exceptional circumstances.

The order in which the modules are taken is not arbitrary, but is designed to ensure that subsequent learning builds on previous learning.

The duration for an examination paper for a 12 credit module should normally be two hours and for 16, 24 or 32 credit modules, three hours.
I.1.12.7 **Moderating of modules, examination papers and answer papers**

General Rules 1.1.1 and 2.4.1 is applicable as well as faculty rules where the requirements of Statutory Councils are stated.

I.1.12.8 **Calculation of module mark**

The module mark (General Rule, footnote 5), is calculated by using the ratio between the participation mark and the examination mark as set out in the study guide and given at the module outcomes at I.11 of this calendar.

I.1.12.9 **Pass requirements**

By virtue of General Rule 2.4.3 the following applies for the Faculty of Engineering:

A final assessment mark in a module will be considered a pass mark if a student, admitted to assessment, has attained the required final module mark of at least 50% in the assessment and provided that the sub-minimum as laid down in the faculty rules has been achieved. (For Engineering modules 40% is the sub-minimum for the examination).

Where a first-time entering student who has registered for the first time for an undergraduate programme at the University fails any first-year module with no less than 40% in the first semester, but achieves an examination mark of at least 50% in that module, the school director concerned may allocate a pass mark of 50% to the student, (2.4.3.2).

The final module mark is made up in accordance with the faculty rules, of the mark attained by the student in the examination and the participation mark in respect of the module, provided that in the calculation of the module mark the weight attached to the participation mark will not be less than 30% and not more than 70%, depending on the specific requirements of the different academic disciplines. The sub-minimum for examinations in all modules will be 40% except where a higher sub-minimum has been laid down in the faculty rules, or study guide (2.3.3.1).

The module mark for each module is, therefore, calculated by the average of the participation mark and the examination mark. The relevant study guide must explain the calculation if it differs from the above. General Rule 2.3.3.1 must be applied.

For all modules being moderated by an external examiner, the final results obtained will be those awarded after the process has be finalised according to Faculty procedures and guidelines for this.

I.1.12.10 **Access to marked examination work**

With reference to General Rule 2.4.9 a student can officially apply at the School Director for access to marked examination work as well as the memoranda.

Application to view answer papers must be made within a maximum period of five working days after the marks have been made available.

If approved the student may view the answer paper and memorandum in the presence of the lecturer and subject group chairperson concerned. Any bona fide errors can be corrected. Students may still make use of the second opportunity of examinations, after access is allowed to marked examination work of the first examination.
I.1.12.11 Repeating of modules

If a student does not pass either of the two examination opportunities following the achievement of a participation mark for a relevant module, the module must be repeated and a new participation mark built up.

Furthermore, it is assumed that if a module is discontinued after the semester test, it will be considered that the module has been taken during that semester.

I.1.13 ASSUMED LEARNING-BASED PROGRESS IN A CURRICULUM

In compiling each curriculum care has been taken that assumed learning, i.e. the necessary prior knowledge and the general level of insight and experience needed to complete the modules prescribed in a specific semester of a curriculum with ease, have been acquired in the preceding semesters.

A student, having failed one or more modules in a preceding semester will, therefore, probably not be adequately equipped to take the modules of the following semester. Such students are advised to consult the director of the relevant school beforehand to find out which modules of the semester concerned they may take with a reasonable expectancy of success.

The aim of the rules is to make sure that a student in any semester will only take those modules for which he has at least the minimum prior knowledge.

When students change from one programme to another, the entrance level in the new programme will have to be determined in consultation with the director of the school under which the relevant curriculum falls.

A module in any curriculum may only be taken if it conforms to the requirements regarding the assumed learning, as indicated in the list of modules.

I.1.13.1 Requirements with respect to assumed prior learning

Regarding the requirements with respect to assumed prior learning of engineering modules, the following apply:

a) Where a first semester module in a certain year level is a prerequisite for assumed prior learning of a second semester module, or a module from one year level is a prerequisite with respect to assumed prior learning of a module of the following year level, a pass mark (module mark) of at least 50% has to be achieved in that prerequisite module, before the following module may be taken.

b) An auxiliary module has to be taken in the same semester as the module on which it has a bearing.

c) A student registered for a degree that leads to professional or statutory registration (i.e. BEng programmes too) may only register for final year modules after all preceding modules have been passed (General Rule 2.3.3.4).

I.1.14 UNSATISFACTORY ACADEMIC PERFORMANCE

Subject to exceptions that may be provided for in faculty rules, "unsatisfactory academic performance" means that a full-time student achieves in a semester less than half the credits required for the curriculum concerned or passes less than half of the modules registered for in the semester.
A student whose academic performance is unsatisfactory receives a formal warning from the dean and is referred for academic advice and study counselling, (General Rule 2.4.7).

In terms of the above the following procedure will apply in the Faculty of Engineering:

A student’s studies can be terminated if he/she has already received three written warnings from the Faculty. A warning letter is issued when:

i) a student has in one semester not obtained admission to the examination for half or more of the modules, and/or fails half or more modules in the examination;

ii) in any three semesters a student does not achieve at least half of the work/credits prescribed for the three semesters;

iii) a student fails a module twice or more; and

iv) it appears that the maximum duration for the degree will be exceeded.

Students, who do not perform satisfactorily in terms of these rules, probably do not have the aptitude or motivation to complete the relevant curriculum successfully.

I.1.15 TERMINATION OF STUDIES

In terms of General Rule 2.4.8, the Rules following below apply in the Faculty of Engineering:

Where a student has already received three warnings from the dean as referred to in 2.4.7.2 and fails for the fourth time to show satisfactory academic performance, or did not obtain permission as referred to in 2.4.6.1 to exceed the maximum duration of the study period, the campus rector may, on the advice of the dean concerned, terminate the student’s studies, and must report such termination to Senate.

A student whose studies have been terminated is not admitted to the same study programme in the subsequent academic year.

A student whose studies have been terminated may apply in the normal manner to be admitted to another study programme, but must in the course of the application mention the termination.

In the event of an application for re-admission the dean concerned has the discretionary authority to set reasonable conditions for such re-admission and must report such conditions to the Vice-Rector.

I.1.16 FACULTY-SPECIFIC RULES FOR THE QUALIFICATION

I.1.16.1 Duration of studies

The minimum full-time study period for the degree is four years and the maximum time for the completion of the degree is six years.

I.1.16.2 Medium of instruction

Lectures of the full-time undergraduate BEng programmes are made accessible by means of educational interpreting into English for students who
do not have sufficient capacity in Afrikaans. In certain modules the language of instruction is English.

In all programmes the examinations and other evaluations may be written and correspondence conducted in either Afrikaans or English. Study guides and other study material are also available in English.

I.1.17  PRACTICAL TRAINING IN INDUSTRY DURING STUDY PERIOD

As part of their programme and training, engineering students have to receive practical experience and undergo specified training in industry during vacations.

Second year students are required to do a module in workshop practice. The purpose of this module is to provide students instruction in workshop practice and the safe use of tools. Students must master the practical use of basic hand tools and manufacturing equipment and have acquired basic knowledge of safety requirements in the workshop and the skills to fabricate small articles. The eleven ELO’s of ECSA will also be introduced and discussed.

Senior students (at the end of year level III) have to perform discipline appropriate vacation work for at least six weeks. It is expected of these students to complete a report on their vacation training, which has to be handed in (together with an employer’s report) at the University soon after completion of the training.

The completion of a short course in occupational safety, presented at the University, is a precondition for this module.

I.1.17.1.1  Occupational safety course

It is expected of all students in their third year of study to attend a course in occupational safety (SHE Solutions).

After the successful completion of the course, a certificate will be issued, of which a certified copy will have to be handed in, together with the report after completion of the discipline-specific training at the end of the third year.

I.1.18  ATTAINMENT OF QUALIFICATION

I.1.18.1  Satisfaction of requirements

The BEng degree is obtained when a student has passed in the examination of all the modules prescribed for the curriculum concerned.

I.1.18.2  Awarding the degree with distinction

In order to receive the degree of Bachelor of Engineering with distinction, a student must complete the degree in the minimum period (four years) and must have achieved a weighted average of 75% for all the modules of the degree over the four years of study.

In the calculation the credit values of modules are also taken into account. Furthermore, year one will count 10%, year two 20%, year three 30% and year four 40 % of the total average.

A student must pass all modules of a relevant engineering programme at the NWU Potchefstroom campus. No module passed elsewhere can be presented with a view to the awarding of the degree with distinction.
A module is passed with distinction if a module mark of 75% is achieved.

I.1.19 OTHER REGULATIONS

I.1.19.1 Equipment

A lecturer has the right, with the consent of the Director, to expect students to acquire certain basic equipment, computer equipment, software, components or consumables if the use of such equipment or material will enhance the value of the module. In considering the possible enhancement of the value of the module, the lecturer will keep the financial implications in mind.

From the first year of study every student has to possess a laptop. The computer has to be Windows compatible with a hard disk and colour monitor. All assignments in all modules in the Faculty have to be completed using a word processing package.

I.1.19.2 Network services

It is expected of all fourth year students in the Faculty of Engineering to have full access to international e-mail, Internet and WWW in order to facilitate the completion of their mini-theses.

Access to these services will be supplied by the LAN of each school and via the Uninet with the co-operation and under the final supervision of the division of Information Technology, Potchefstroom Campus.

All regulations issued by the University, and revised from time to time, with respect to the use of the computer facilities of the University, will also be applicable to students and the services utilized by them. Regulations issued by the Faculty of Engineering, and revised from time to time, are also relevant. Any transgression of these Regulations may lead to disciplinary steps.

I.1.20 SCHOOLS IN THE FACULTY OF ENGINEERING

The Faculty of Engineering consists of four Schools. At the head of each school is the Director who is assisted by programme leaders. The schools are responsible for teaching the undergraduate and graduate programmes. The schools and the programmes offered in each school are shown in the following table:

<table>
<thead>
<tr>
<th>School</th>
<th>Programmes</th>

Further information is available on the web page of the research unit at http://www.nwu.ac.za/p-fe/currentres.html

I.1.21 QUALIFICATIONS, PROGRAMMES AND CURRICULA

In the Faculty of Engineering different qualifications (degrees) can be obtained. A particular qualification can be obtained in one of seven fields. In each undergraduate programme a set curriculum is followed.

Information on and the rules for the different qualifications, study directions/programmes and curricula for undergraduate study, are expounded in this Calendar.

The Faculty of Engineering is entitled to award the following undergraduate degrees:

<table>

I.2 RULES FOR THE DEGREE OF BACHELOR OF ENGINEERING

The BEng degree may be taken in one of seven programmes:

- Chemical Engineering
- Chemical Engineering with specialization in Minerals Processing
- Electrical and Electronic Engineering
- Computer and Electronic Engineering
- Electromechanical Engineering
- Mechanical Engineering
- Industrial Engineering

These programmes, which are described in detail below, may be taken by full-time study only.

During their studies students may change from one programme to another or change the programmes for which they are registered only with the consent of the relevant school director and programme manager.

I.2.1 FACULTY RULES

By virtue of General Rule 1.6 the following is stipulated:

i) Every faculty board makes, subject to these Rules, faculty rules with regard to the qualification programmes offered by the specific faculty and submits those rules to Senate for approval.

ii) Faculty rules may where appropriate, in addition to matters provided for in these Rules, provide for arrangements that may be necessary for the accommodation of qualification-specific requirements and faculty-specific procedures and structures.

iii) The venue or venues where every qualification programme or curriculum is presented as well as the method of delivery thereof, are determined by faculty rules within the framework of institutional policies.

iv) Faculty rules are published in the calendar of the relevant faculty.

v) Where faculty rules are amended before the next version of the calendar is published, steps that are reasonably necessary must be taken to bring the amendments to the attention of students who are affected thereby.

I.2.2 MINIMUM AND MAXIMUM DURATION

The minimum full-time study period for the degree is four years and the maximum time for the completion of the degree is six years.
I.2.3 COMPOSITION OF THE CURRICULUM

I.2.3.1 Purpose of the Qualification

The purpose of the BEng qualification, as stipulated by ECSA, is to build the necessary knowledge, understanding, abilities and skills required for further learning towards becoming a competent practicing engineer. The recognised purpose of this bachelor’s degree in engineering, accredited as satisfying this standard is to provide graduates with:

1. Preparation for careers in engineering and related areas, for achieving technical leadership and to make a contribution to the economy and national development;
2. The educational requirement towards registration as a Professional Engineer with the Engineering Council of South Africa as well as to allow the graduate to make careers in engineering and related fields;
3. A thorough grounding in mathematics, natural sciences, engineering sciences, engineering modelling, engineering design and the abilities to enable applications in fields of emerging knowledge together with an appreciation for the world and society in which engineering is practised;
4. For graduates with an appropriate level of achievement in the programme, the ability to proceed to postgraduate studies in both course-based and research masters programmes.

I.2.3.2 Qualification outcomes

I.2.3.2.1 General

The curriculum for the first year of study consists mainly of natural science modules, namely Chemistry, Mathematics, Applied Mathematics, Physics and Computer Programming. Certain introductory engineering modules are also presented in the first year. These include Professional Practice I in which the work of engineers in the different disciplines, the principles and theory of project management, the principles and theory of systems engineering, computer programmes such as Word, Excel and Power Point and learning, listening, reading and writing strategies are presented.

In the second year of study more engineering science modules are offered, together with selected natural science modules, which differ for the different branches.

The curricula for the third and fourth years of study consist mainly of engineering science modules with a few science and management modules. In the final year the emphasis is on design and synthesis, with design and project modules fulfilling an important part.

While formal modules in computer science and information technology are offered up to second year level, great emphasis is placed throughout the curriculum on computer applications in engineering.

I.2.3.2.2 Exit-level outcomes

The curricula of all the undergraduate engineering programmes at the NWU are compiled in order to comply with the exit-level outcomes required by the Engineering Council of South Africa, namely:
Outcome 1: Engineering problem solving;
Outcome 2: Application of scientific and engineering knowledge;
Outcome 3: Engineering design and synthesis;
Outcome 4: Investigations, experiments and data analysis;
Outcome 5: Engineering methods, skills and tools, including information technology;
Outcome 6: Professional and technical communication;
Outcome 7: Sustainability and impact of engineering activity;
Outcome 8: Individual, team and multidisciplinary working;
Outcome 9: Independent learning ability;
Outcome 10: Engineering Professionalism;
Outcome 11: Engineering management.

I.2.3.2.3  Articulation Possibilities
The exit-level outcomes ensure that a graduate of a programme meeting these standards would meet requirements for entry to a number of programmes including:

- A candidacy programme toward registration as a Professional Engineer
- Formal specialist study toward the Postgraduate Diplomas;
- A postgraduate Bachelor of Laws (LLB) programme;
- Specialist coursework masters programmes;
- Research masters programmes leading to masters degrees with or without coursework components;
- With appropriate work experience, a Master of Business Administration or similar;
- In certain disciplines, progression toward the Government Certificate of Competency.

The basic and applied skills which the graduates, with this qualification, will have acquired in the mathematical, computer and basic scientific and engineering disciplines, will equip them to continue with learning in various specialized areas at other institutions.

I.2.3.3  Knowledge
At the end of his/her studies the student will have scientific knowledge and insight stretching across one or more areas. This will include factual knowledge, but especially also knowledge of and insight into concepts, structures, procedures, models, theories, principles, research methods and the place and boundaries of science in human existence.

I.2.3.4  Skills
At the end of the study the student should be able to demonstrate competence to:

Identify, assess, formulate and solve convergent and divergent engineering problems creatively and innovatively;
Apply knowledge of mathematics, basic science and engineering sciences from first principles to solve engineering problems;

Perform creative, procedural and non-procedural design and synthesis of components, systems, engineering works, products or processes;

Design and conduct investigations and experiments;

Use appropriate engineering methods, skills and tools, including those based on information technology; and

Communicate effectively with engineering audiences and the community at large, both orally and in writing.

I.2.3.5 Values

The following values are pursued:

Critical awareness of the impact of engineering activity on the social, industrial and physical environment.

Competence to work effectively as an individual, in teams and in multidisciplinary environments.

Competence to engage in independent learning through well-developed learning skills.

Critical awareness of the need to act professionally and ethically and to exercise judgement and take responsibility within own limits of competence.

I.2.3.6 Phasing in and out of programmes / curricula

The directors of all schools concerned, in consultation with the subject chairs / programme managers, issue transitional rules where necessary in order to facilitate the transition from existing programmes to new programmes.

If the curriculum for which a student registered in the previous year was amended in this calendar, the student’s curriculum will be adjusted to correspond with the version in this calendar. If at all possible, adjustments will be made in such a manner that a student's study load is not increase.
I.3 SCHOOL OF CHEMICAL AND MINERALS ENGINEERING

Two BEng programmes, Chemical Engineering and Chemical Engineering with specialization in Minerals Processing, are offered in the School.

Chemical Engineers are involved in the research, design, development and management of industrial processes where raw materials are converted to products with higher economic value.

Chemical Engineering involves the research, development, construction, operation and management of those industrial processes in which raw materials are transformed by chemical or physical means to products with a higher economic value. These processes are concerned with the areas of plastics, synthetic fibres, oil refining, explosives, food processing, fertilisers, pharmaceutical drugs and nuclear installations. The modern chemical engineer may be involved in any stage, from the conception phase of a process to the sale of the final product.

These processes exist in the manufacturing of plastic, synthetic fibres, fuel refining, explosives, processing of foods, fertilisers, pharmaceutical and nuclear industries. Think of processes such as the ones that turn corn to cornflakes, hops to beer, coal to petrol and algae to electricity.

Minerals Processing is a specialist field in Chemical Engineering and deals with the physical and chemical processes used especially to extract metals from ores.

I.3.1 CHANGING A PROGRAMME

During their study, students may only change their programme with the consent of the School Director.

I.3.2 PRESCRIBED MODULES

In the curriculum of each programme there are a number of compulsory modules: FIAP172, FIAP271 (Professional Practice I and II), WVTS211 (Understanding the Technological World) and WVIS321 (Science, Technology and Society). A fixed curriculum is followed for both branches.

I.3.3 TOTAL CREDIT VALUE OF PROGRAMMES

The curricula of the programmes in this branch of engineering consist of modules with a total credit value of at least 616 for Chemical Engineering and 624 for Chemical Engineering with specialization in Minerals Processing.

In the following programme curricula, the total number of credits is spread over four years of study.

Total credits of programme: 624
I.4 SCHOOL OF ELECTRICAL, ELECTRONIC AND COMPUTER ENGINEERING

Three BEng programmes, Electrical and Electronic Engineering, Computer and Electronic Engineering and a new programme in Electromechanical Engineering (starting in 2015) are offered in this School.

Electrical and Electronic Engineering

NWU Electrical and Electronic Engineers enable the modern world by moving electrical energy from the source to the point of application. They do this as efficiently as possible, by applying their knowledge of power systems, power conversion, power conditioning, and electrical machines. Training provided by leading experts in power quality, power electronics and electrical machines, sets NWU Electrical and Electronic Engineers apart in industry. Our engineers set the pace in power utilities and electrical consulting industries and relate well to the challenges of utilizing renewable energy sources as part of the energy solution of the future.

Computer and Electronic Engineering

NWU Computer and Electronic Engineers make the world a more efficient place by connecting humans and the world we live in, to the digital world of computer systems and the internet. They do this by using electronics, embedded computers and the skill of programming to control mechatronic systems and to build the internet of things. Their end-to-end design experience makes NWU Computer and Electronic Engineers highly desirable in industries ranging from telecommunications, process control, and aviation through to the banking sector and software development companies.

Electromechanical Engineering

NWU Electromechanical Engineers ensure the safe and efficient operations of plants and factories by combining elements of electrical and mechanical engineering. Their knowledge of electrical machines, power electronics, strength of materials and heating, ventilation and air-conditioning systems, together with legal knowledge with respect to occupational health and safety make them invaluable to industry. Our degree is well aligned with the Government Certificate of Competence (GCC) requirements and candidates make a natural transition towards obtaining the GCC after completion of the degree. Our engineers will serve the Mining, Materials Handling, Power Generation, Chemical, Oil and Gas industries.

I.4.1 CHANGING A PROGRAMME

During their study, students may only change their programme with the consent of the relevant School Director.

I.4.2 PRESCRIBED MODULES

In the curriculum of each programme there are a number of compulsory modules: FIAP172, FIAP271 (Professional Practice I and II), WVTS211 (Understanding the Technological World) and WVIS321 (Science, Technology and Society). A fixed curriculum is followed all three branches.
I.4.3 TOTAL CREDIT VALUE OF PROGRAMMES

The curricula of the programmes in this branch of engineering consist of modules with a total credit value of at least 616 for Electrical and Electronic Engineering and 608 for Computer and Electronic Engineering.

The Electromechanical Engineering Programme started in 2015 and for 2017 consists of modules with a total credit value of at least 616.

In the following programme curricula, the total number of credit points is spread over four years of study.

I.4.4 CURRICULA

I.4.4.1 Programme: BEng in Electrical and Electronic Engineering

Qualification code: 7CN K01 [previously 700 107 – I203P]

I.4.4.1.1 Total credit value of programmes

Due to the implementation of revised programmes for the Faculty of Engineering credits and contents of modules are revised and a few adjustments have been made to the programmes.

The credit values indicated in the tables below are those of the new programmes and for seniors it differs as a result of adjustments forced by the phasing out of old programmes.

Compilation of curriculum

This curriculum is composed as follows (I401P):

<table>

**BEng in Computer and Electronic Engineering**

Qualification code: 7CH K01 [previously 700 108 – I204P]

Programme: BEng in Electromechanical Engineering

Qualification code: 7CL K01 [previously 700 113 - I205P]

(This is a new programme phasing in from 2015, year level 1. The first graduates will complete this programme in 2018).

**I.4.4.3.1 Total credit value of programmes**

Due to the implementation of revised programmes for the Faculty of Engineering credits and contents of modules are revised and a few adjustments have been made to the programmes.

The credit values indicated in the tables below are those of the new programmes and for seniors it differs as a result of adjustments forced by the phasing out of old programmes.

**Compilation of curriculum**

This curriculum is composed as follows (I401P):

<table>
<thead>
<tr>
<th>Year level 1</th>
<th>Code</th>
<th>Module name</th>
<th>C/F</th>
<th>Cr</th>
</tr>
</thead>
<tbody>
<tr>
<td>1st sem.</td>
<td>FSKS111</td>
<td>Mechanics, Oscillations, Waves and Theory of Heat</td>
<td>C</td>
<td>12</td>
</tr>
<tr>
<td>2nd sem.</td>
<td>INGM111</td>
<td>Engineering Graphics I</td>
<td>C</td>
<td>12</td>
</tr>
<tr>
<td>1st sem.</td>
<td>ITRW115</td>
<td>Programming for Engineers I (C++)</td>
<td>C</td>
<td>12</td>
</tr>
<tr>
<td>2nd sem.</td>

**Total credits of program:** 616
I.5 SCHOOL OF MECHANICAL AND NUCLEAR ENGINEERING

Two BEng programmes, viz. Mechanical Engineering, and a new programme in Industrial Engineering are offered in this School.

Specialization in Nuclear Engineering is possible from year level three, with the offering of the elective modules Nuclear Energy, Nuclear Engineering I and II as well as a Project in Nuclear Engineering in the final year. This will ensure the proven learning skills for post-graduate studies in Nuclear Engineering.

Mechanical Engineers are involved with the development, manufacturing, management and maintenance of transport, energy conversion, manufacturing, generator, weapon and cooling and heating systems, as well as industry installations, process equipment, manufacturing machinery and mining equipment.

The Mechanical Engineering programme maintains a good balance between training in the basic sciences, engineering science and design. Strong emphasis is placed on creative synthesis (design), in order to enable engineers to apply their knowledge in finding solutions to complicated technological problems.

Nuclear Engineers design systems that utilizes nuclear processes for energy. Ultimately Mechanical and Nuclear Engineers play important roles in all engineering projects to ensure that designs are innovative, well planned, safe, effectively implemented, manufactured and maintained.

Industrial Engineers enable people, technology, information, materials, methods and money to work together productively and effectively.

It is an Industrial Engineer who helps on an airport to decide when and from which gate airplanes should depart or in a hospital how many beds and nurses to be allocated to each hospital ward. Whether you use a motor vehicle, a chocolate bar or a cell phone or whether you withdraw money or withdraw blood, you can be pretty sure that an Industrial Engineer was involved in the design, manufacturing or distribution of that product or service.

I.5.1 CHANGING A PROGRAMME

During their study, students may only change their programme with the consent of the relevant School Director.

I.5.2 PRESCRIBED MODULES

In the curriculum of each programme there are a number of compulsory modules: FIAP172, FIAP271 (Professional Practice I and II), WVTS211 (Understanding the Technological World) and WVIS321 (Science, Technology and Society). A fixed curriculum is followed.

I.5.3 TOTAL CREDIT VALUE OF THE PROGRAMME

The curriculum of the programme for Mechanical Engineering consists of modules with a total credit value of at least 636. The Industrial Engineering Programme started in 2015 and for 2017 consists of modules with a total credit value of at least 604. In the following programme curricula the total number of credit points is spread over four years of study.
I.5.4 CURRICULA

I.5.4.1 Programme: BEng in Mechanical Engineering

Qualification code: 7CJ K01 [previously 700 109 - I303P]

I.5.4.1.1 Total credit value of programmes

Due to the implementation of revised programmes for the Faculty of Engineering credits and contents of modules are revised and a few adjustments have been made to the programmes.

The credit values indicated in the tables below are those of the new programmes and for seniors it differs as a result of adjustments forced by the phasing out of old programmes.

I.6 LIST OF PROGRAMME MODULES

I.6.1 MODULE TYPES

Core modules mean those modules at all levels of a programme or curriculum which have been designated as such by the faculty concerned (A.1.13).

Fundamental modules mean those modules which give expression to the critical cross-field outcomes and which students have to take in order to comply fully with the education, training or further learning required for the attainment of a qualification (A.1.33).

I.6.2 METHOD OF DELIVERY

All modules are presented full-time by means of contact teaching. A few modules entail vacation training, which is performed during the university vacation.

I.6.3 ASSESSMENT METHODS

Arrangements and requirements in connection with assessment will be communicated to students at the start of each semester. They are also fully explained in each relevant study guide.

Assessment methods include:

- Formative assessment methods - homework, class tests, semester tests, practical reports, assignments and other applicable methods.

- Summative assessment methods – Usually a 2 to 3 hour examination-paper. Exceptions are indicated in the study guides of the relevant modules.

I.6.4 CREDIT VALUE AND PREREQUISITES

The list of modules from which the curricula of all the programmes are compiled and the credit value of each module is given in the table below. The requirements with respect to assumed learning are given for each module in the last column in the table. (See also I.2.8)

Regarding the requirements with respect to assumed prior learning of engineering modules, the following apply:

a) Where a first semester module in a certain year level is a prerequisite for assumed prior learning of a second semester module, or a module from one year level is a prerequisite with respect to assumed prior learning of a module of the following year level, a pass mark (module mark) of at least 50% has to be achieved in that prerequisite module, before the following module may be taken.

b) An auxiliary module has to be taken in the same semester as the module on which it has a bearing.

</tr>
</tbody>
</table>

**Module code: CEMI121 | Semester 2 | NQF level: 5**

**Name:** Process Principles I

**Module objective:** Teaching of the basic calculations with a focus on material balances, as applicable to Chemical and Minerals engineering.

**Module outcomes:**
After successful completion of this module, students should have the following:

**Knowledge:**
Students obtain formal knowledge of different unit systems, process data handling, dimensional homogeneity, the mol unit, chemical and mineral processes and process variables, fundamentals of material balances, degrees of freedom, stoichiometry, multiple material balances, recovery and bypass streams, reactive processes, combustion processes, single phase processes.

**Skills:**
- Being able to carry out elementary chemical calculations, convert between different unit systems and know the concept of dimensional homogeneity.
- To know about the different types of chemical processes and know the most important process variables.
- Understand the fundamentals of material balances and apply these fundamentals to single and multiple unit processes with and without reaction.
- Know how to find, calculate or estimate the relevant physical properties of single-phase systems.

<table>

</tbody>
</table>

**Module code: CEMI211 | Semester 1 | NQF level: 6**

**Name:** Materials and Corrosion

**Module objective:** To obtain knowledge on materials, material selection and corrosion processes. To understand the atomic structure and bonding in materials resulting in mechanical properties of metals and alloys, polymers and ceramics. To obtain knowledge on corrosion and corrosion prevention.

**Module outcomes:**
After successful completion of this module, the student should have:

**Knowledge:**
The student will be able to understand materials, material strength, corrosion and corrosion prevention to make decisions on material selections.

**Skills:**
- Ability to identify the different materials, such as metals, polymers and ceramics.
- Ability to understand the processing of these materials.
- Ability to solve material problems encountered in a chemical engineering environment.
- Ability to identify and describe corrosion processes, electrochemical corrosion and galvanic corrosion.
- Solve corrosion problems and determine corrosion rates and how corrosion control is implemented.

**Module code: CEMI213 | Semester 1 | NQF level: 6**

**Name: Electrotechnics for Chemical Engineers**

*Module objective:* The objective of this module is to equip students with a critical understanding of how the field of electrotechnics is applicable to the basic training of the chemical engineer.

*Module outcomes:*
- Knowledge and informed understanding of the basic terms related to electricity, including AC/DC, as well as three-phase and single-phase power;
- Critical understanding of and the ability to analyse and evaluate basic power generation within the South African context, including renewable energy;
- Detailed knowledge of the basic working of transformers and electrical motors with a view to understand the application of these components on a process plant;
- The ability to understand measurement (pressure, temperature, flow, density and level) in order to be able to select the correct instrumentation for measurement in chemical processes;
- Detailed knowledge and understanding of, and the ability to demonstrate the working of various kinds of valves in different scenarios; and
- The ability to work as part of a team to solve practical problems in the field of electrotechnics.

**NOTE:** New module from 2016. Previous module was EERI212.

Credits: 8

Prerequisite: none

Assessment modes: PC 3 hours 1:1

---

**Module code: CEMI222 | Semester 2 | NQF level: 6**

**Name: Chemical Thermodynamics I**

*Module objective:* The main objective of this module is to equip students with the fundamental skills to perform energy, entropy and mass balances to solve energy, flow and general thermodynamic problems. Furthermore, the students will learn how to select specific equations of state or correlations to describe and analyse different processes that are relevant to the chemical process industry. Finally, the students will be taught how to integrate the different concepts through the use of fundamental property relations and the Maxwell relations.

*Module outcomes:*
- After successful completion of this module, the student should be able to:
  - Knowledge:
    - The students will have gained knowledge of the 1st and 2nd law of thermodynamics and should have learned how to solve energy and entropy balances using thermodynamic concepts.
  - Skills:
    - Perform energy, entropy and mass balance calculations for open and closed systems.
    - Use equations of state or generalized correlations to describe any fluid, and be able to calculate the compressibility factor of gases.
    - Establish thermodynamic property relationships for any system and select appropriate equations of state for calculating thermodynamic properties in terms of the measureable system properties temperature and pressure.
    - Describe and analyse the thermodynamic properties of a fluid at each location in refrigeration, liquefaction, and power generation cycles.
    - Appreciate mechanical work in solving thermodynamic problems.

Credits: 16

Prerequisite: CEMI121

Assessment modes: PC 3 hours 1:1

---

**Module code: CEMI224 | Semester 2 | NQF level: 6**

**Name: Process Principles II**

*Module objective:* To understand and apply energy balances for design and operational problems of industrial processes.

*Module outcomes:*
- After successful completion of this module students should have the following:
Knowledge:
Knowledge about energy balances, the first law of thermodynamics, forms of energy, heat capacity of gasses; liquids and solids, enthalpy of mixtures and solutions; enthalpy-concentration diagrams; enthalpy of formation, vapourisation, melting, combustion and solutions; combustion of fuels, and should be able to integrate this to solve energy balances over processes.

Skills: The student will have developed the following skills:
- Ability to identify the different forms of energy.
- Ability to solve energy balances on closed and open systems, with or without reactions taking place, whilst accounting for scenarios such as phase change, mixing and solutions.
- Ability to simultaneously solve energy and material balances on simple systems.

Credits: 8
Prerequisite: CHEM121 and CEMI121
Assessment modes: PC 3 hours 1:1

Module code: CEMI311  Semester 1  NQF level: 7

Name: Transport Phenomena I

Module objective: An introductory course in the basic fundamentals and applications of momentum transfer. This module has the main objective of introducing the student to the theory and application of momentum transfer so that he/she will be able to apply the acquired knowledge to practical momentum transfer problems.

Module outcomes:
After successful completion of this module, the student should have:

Knowledge:
- Basic knowledge and insight in the mechanisms of fluid dynamics;
- Be able to use mass, energy and momentum balances to describe fluid motion on the macroscopic level;
- Be able to describe the motion of a fluid on the microscopic level by making use of velocity profiles and differential analysis;
- Be able to do dimensional analyses to derive important correlations which determine the type of flow;
- Know and be able to use Buckingham's theory;
- Be able to describe fluid flow where friction is relevant and to use the relevant correlations to calculate friction factors;
- Be able to use the above-mentioned knowledge to describe both internal and external flow; and
- Know and be able to apply the basic theory and applications regarding fluid machines.

Skills:
- Be able to describe internal and external flow systems using basic flow dynamics;
- Know and be able to apply dimensional analyses for further study;
- Be able to design reaction and impulse turbines
- Be able to generate and process experimental data and prepare an appropriate report on the findings; and
- Be able to use sources such as the internet and library to obtain and study relevant information on flow dynamics.

Credits: 16
Prerequisite: CEMI224
Assessment modes: PC 3 hours 1:1

Module code: CEMI313  Semester 1  NQF level: 7

Name: Chemical Thermodynamics II

Module objective: The main objective of this module is to help students develop fundamental skills and knowledge in the field of chemical thermodynamics, relevant to some basic operations in the chemical process industry.

Module outcomes:
After successful completion of this module, the student should have the following:

Knowledge:
The student should have gained knowledge in performing complex thermodynamics calculations.
w.r.t. determining the composition of coexisting phases during phase separation, and predicting the extent to which a reversible chemical reaction proceeds.

**Skills:**
- Understand the importance of the Gibbs energy and the chemical potential in relation to equilibrium calculations.
- Understand the concept of fugacity as a key-parameter in equilibrium calculations.
- Perform fugacity calculations for species in the gas and liquid phases.
- Calculate the composition of coexisting phases, mainly w.r.t. Vapour-Liquid Equilibrium (VLE) and Liquid-Liquid Equilibrium (LLE) from first principles.
- Describe a reversible chemical reaction/system of reactions in terms of the equilibrium extent of the individual reactions/ single reaction.
- Co-operate effectively in group work.
- Act ethically sound in presenting results, findings, interpretations and personal views in problem solving activities.
- Reveal applicable communication skills.
- Think critically and innovatively in all problem solving activities.

**Credits:** 16
**Prerequisite:** CEMI222 and CEMI224
**Assessment modes:** PC 3 hours 1:1

---

**Module code: CEMI315 | Semester 1 | NQF level: 7**

**Name:** Biotechnology I

**Module objective:** An introductory course in the basic fundamentals and applications of biotechnology. The aim of this module is to expose engineering students to the principles and concepts of biotechnology and how it relates to engineering problems.

**Module outcomes:**
After successful completion of this module, the student should have:

**Knowledge**
- Formal knowledge about:
  - The importance of chemical engineering within the field of biotechnology.
  - Cell biology and the structure and function of bio-molecules: carbohydrates, lipids, proteins and nucleic acids.
  - Enzymatic and microbial fermentation.
  - Cell growth.

**Skills**
- The ability to perform the following:
  - Design and execute simple biochemical experiments.
  - Collect and process experimental data.
  - Solve problems related to enzymatic and microbial fermentation.

**Credits:** 8
**Prerequisite:** none
**Assessment modes:** PC 3 hours 1:1

---

**Module code: CEMI316 | Semester 1 | NQF level: 7**

**Name:** Particle Systems

**Module objective:** Teaching the fundamentals of particle systems and the design of processes to be able to handle particles.

**Module outcomes:**
After successful completion of this module students should have the following:

**Knowledge:** Knowledge of the properties of particles and the handling of dry particles, the properties of slurries and the handling thereof and to design equipment that can handle these systems. The student will also have knowledge of solid-liquid separation system and to design the appropriate equipment.

**Skills:**
- Describe populations of particles in terms of their physical and chemical properties, to design screens and other apparatus to classify particles in terms of size and or density.
- Design systems to store and convey particles.
- Describe slurries in terms of physical properties such as density and viscosity.
- Design mixer tanks, piping systems and pumps to transport slurries, to design and describe waste dumps.
- Design settling dams, thickeners, filters and thermal dryers.
- Describe the operating aspects of all the above mentioned processes and to understand and describe the interaction between the different processes.
- Use laboratory equipment to obtain information, experimentally, on the above mentioned processes for later use in design and optimisation thereof.

**NOTE:** Previously CEMI413

**Credits:** 16

**Prerequisite:** CEMI121

**Assessment modes:** PC 3 hours 1:1

---

**Module code:** CEMI321  |  **Semester 2**  |  **NQF level:** 7

**Name:** Transport Phenomena II

**Module objective:** Teaching of heat and mass transfer principles while also learning to use these skills in the development and/or design of heat and mass transfer equipment such as TEMA type heat exchangers.

**Module outcomes:**
After successful completion of this module, the student should:

**Knowledge:**
- Have knowledge of and insight into the mechanisms of conduction, convection, radiation, diffusion-mass transfer and convective mass transfer;
- Be able to determine transfer rate for steady-state and non-steady-state conduction;
- Be able to use numerical, as well as graphical techniques to solve conduction problems;
- be able to do dimensional analyses for convective systems and be able to solve natural and forced convection problems;
- Be able to determine transfer coefficients for convection systems
- Be able to solve heat transfer for simultaneous conduction and convection systems;
- Be able to solve transfer for simultaneous heat and mass transfer systems;
- Be able to use the concept of black and grey bodies to solve radiation problems;
- Know the laws of radiation and be able to apply them to solve the heat transfer by radiation for different systems;
- Be able to apply Fick's law to shell balances to solve steady-state and non-steady-state mass transfer problems;
- Be able to calculate the mass transfer for flow over a flat plate, spheres, cylinders and packed beds by using the different analogies between momentum, mass and heat transfer; and
- Be able to determine the mass transfer rate for different systems.

**Skills:**
The student should be able to:
- Calculate heat and mass transfer rate for different systems;
- Design systems for effective heat and mass transfer;
- Analyse shell and tube heat exchangers using HTRi software; and
- Design shell and tube heat exchangers to comply with an industrial design specification.

**Credits:** 16

**Prerequisite:** CEMI224 and CEMI311

**Assessment modes:** PC 3 hours 1:1

---

**Module code:** CEMI322  |  **Semester 2**  |  **NQF level:** 7

**Name:** Separation Processes I

**Module objective:** Development of skills for the conceptional design, modelling, optimization and selection of equilibrium-based separation processes, with specific reference to absorption, stripping and distillation. Application of basic knowledge in the development of more complex processes.

**Module outcomes:**
After successful completion of this module, students should have the following:

**Knowledge:**
Formal knowledge about the following:
- The various separation processes with specific focus on distillation, absorption and stripping.
- The appropriate equipment necessary in these separation processes.
- The use of thermodynamic models in equilibrium-based separation processes.
- The advantages and disadvantages of various design choices.

**Skills:**
The ability to perform the following:
- Flash calculations in multi-component processes.
- Design of adsorption, stripping and distillation columns for binary and multi-component feed streams.
- Troubleshoot and optimize separation processes.
- Simulate a distillation column using ASPEN/HYSYS.

**Credits:** 16
**Prerequisite:** CEMI313
**Assessment modes:** PC 3 hours 1:1

**Module objective:** The main objective of this module is to equip students with the basic fundamentals of chemical reactor theory and the design of different types of reactors on an advanced level with the focus on suitable engineering problem solving. Use of all accumulated engineering knowledge and skills, specifically mass- and energy balances and thermodynamic concepts applicable to problem solving. Skills that are developed are based on the utilization of the theory of the kinetics of homogeneous reactions for problem solving in reaction systems of industrial importance and catalytic reactions, with the focus on reactor design.

**Module outcomes:**
After successful completion of this module, students should have the following:

**Knowledge:**
The student will have obtained formal knowledge about reaction kinetics and reaction rates for different reaction systems, operation and functioning of different reactor types, derivation of operations and design equations from first principles for a variety of reactor types, isothermal and non-isothermal operation and design, Pressure drop across reactors, non-steady-state operation of reactors, recirculation reactors, membrane reactors, thermodynamic effects and multiple reactions.

**Skills:**
- Perform reaction and reactor problems using analytical and numerical methods;
- Use of different industrial design software for the design of a reactor and reaction systems;
- Operation of different reactors,
- Measuring of certain experimental quantities and the processing of results to meaningful deductions in order to reach conclusions, communicated professionally in a practical Report.

**Credits:** 16
**Prerequisite:** CEMI121
**Assessment modes:** PC 3 hours 1:1

**Module objective:** The objective of this module is to equip the student with skills to perform dynamic modelling of processes, to be able to solve such models and to perform techniques on such models to be able to analyse and assess the behaviour of processes in order to eventually control such processes.

**Module outcomes:**
After completion of module, the student should be able to demonstrate:

**Knowledge:**
- A basic overview knowledge of the discipline of process modelling and control.
- A thorough understanding of the behaviour of first- and higher-order processes through behaviour analysis techniques.
- Knowledge of the fundamental- and empirical approaches to modelling chemical processes.

**Skills:**
- Skills to develop steady-state and dynamic models that describe chemical process behaviour.
Mathematical skills to solve differential equations that describe process dynamics.
- Skills in using computer packages to solve differential equations that describe chemical process dynamics.
- Mathematical skills to linearize non-linear process models as well as to determine process stability of such processes.
- Ability to work individually and in groups.

**NOTE:** New module from 2015. Previous module was CEMI324.

**Module objective:** To give students a strong foundation in simulations using Aspen by designing real life chemical process applications. To impart knowledge on chemical processes environmental impact and give a foundation on environmental management systems. To bring an awareness of hazards linked to chemical processes and explore possible safety solutions.

**Module outcomes:**
After successful completion of this module, the student should:

**Knowledge:** Be competent to perform procedural and non-procedural design and synthesis of engineering products or processes. Should have acquired knowledge on environmental management systems and risk assessment from a chemical engineering context. Be able to handle and have an overview of environmental related design problems such as water related (BOD) and air pollution related (stack design). Students should be able to do hazard analyses on chemical plants and process components.

**Skills:**
- Understand the application of Aspen in solving engineering problems.
- Appreciate and be able to link environmental hazards associated with chemical processes and address problems using engineering knowledge acquired up to so far.
- Developed analytical and problem solving skills.
- Be able to carry out a HAZOP analysis on chemical processes and plants.

**Module code:** CEMI328  
**Semester:** 2  
**NQF level:** 7

**Name:** Plant Design I

**Module objective:** To impart knowledge on chemical processes environmental impact and give a foundation on environmental management systems. To bring an awareness of hazards linked to chemical processes and explore possible safety solutions.

**Module outcomes:**
After successful completion of this module, the student should:

**Knowledge:** Be competent to perform procedural and non-procedural design and synthesis of engineering products or processes. Should have acquired knowledge on environmental management systems and risk assessment from a chemical engineering context. Be able to handle and have an overview of environmental related design problems such as water related (BOD) and air pollution related (stack design). Students should be able to do hazard analyses on chemical plants and process components.

- Appreciate and be able to link environmental hazards associated with chemical processes and address problems using engineering knowledge acquired up to so far.
- Developed analytical and problem solving skills.
- Be able to carry out a HAZOP analysis on chemical processes and plants.

**Module code:** CEMI411  
**Semester:** 1  
**NQF level:** 8

**Name:** Separation Processes II

**Module objective:** Teaching of applicable separation processes, as well as the development of skills in order to solve problems in this field using the necessary calculations.

**Module outcomes:**
After successful completion of this module, students should have the following:

**Knowledge:** The students will acquire the knowledge about the concepts and technologies related to water purification, membrane separation processes, solubility of elements, leaching, precipitation, crystallisation, solvent extraction, ion exchange, electro winning and electro refining.

**Skills:**
- Demonstrate sufficient knowledge about the context of water pollution and remediation strategies to restore water suitable for drinking purposes.
- Must be able to identify the type of membrane adequate for a given task and predict its performance.
- Ability to explain the behaviour of elements in solution through construction of the pourbaix diagram and application of thermodynamic principles.
- Ability to advise on a suitable leaching technique based on the grade and the mineralogical composition of the compound.
- Ability to determine optimum conditions for higher leaching rate.
- Recognise the limitations and the advantages of the various metal purification techniques.
- Must be able to determine the capacity and specificity of extracting matrices in ion exchange.
and solvent extractions systems.
- Must be able to establish conditions suitable for the separation or purification of metals through precipitation.
- Ability to explain the mechanisms of electro winning and electro refining, as well as suggest optimization conditions based on information obtained through calculations.

**Module objective:** All chemical engineers must have a basic knowledge of reactors and their operation. The objective of this module is to teach students advanced concepts concerning the design of reactors. The skills acquired in this module build on the knowledge that the student has acquired in his/her third year.

**Module outcomes:**
After successful completion of this module, the student should have:

**Knowledge:**
- Knowledge and insight to use simple models for non-ideal flow to predict the conversion in a non-ideal reactor.
- Develop models to predict the flow patterns in a reactor.
- Design a reactor for a heterogeneous catalytic reaction with complex reaction kinetics.
- Design reactors for reactions with de-activating and poisoned catalysts.
- Design reactor-regenerator systems for de-activating catalysts.
- Design reactors for non-catalytic heterogeneous reactions.
- Design reaction tanks and towers for gas-liquid reactions with adsorption.
- Design multiphase reactors and analyse biochemical reactors.
- Analyse and design reactors.

**Skills:**
- Realise the importance of optimal chemical reactor design for the chemical industry.
- Predict non-ideal flow patterns and develop suitable models of the flow.
- Design reactors with heterogeneous catalytic reactions having complex kinetics.
- Consider deactivation of catalysts in a heterogeneous reaction.
- Design tanks and towers for gas/liquid reactions.
- Design multiphase reactors, as well as biochemical reactors.

**Module objective:** The objective of this module is to equip the student with skills to design simple feedback as well as more advanced control systems for chemical processes, to use techniques to tune such controllers, to assess the stability thereof and to be acquainted with multivariable processes and controllers. Plant-wide control strategies also receive attention.

**Module outcomes:**
After successful completion of this module, the student should have:

**Knowledge:**
- Detailed knowledge of measuring equipment (sensors) as well as actuators (valves, conveyor belts) for efficient design of control systems
- A thorough understanding of feedback control theory, stability criteria and tuning techniques
- A thorough understanding and knowledge of advanced control systems
- Knowledge and understanding of control strategies and techniques for multivariable control systems
- Knowledge in designing and implementing plant-wide control strategies

**Skills:**
- Skills to implement both simple feedback controllers as well as advanced controllers on existing process models and/or simulations
• Mathematical and computer literacy to perform a frequency response analysis on processes and to efficiently use this information in the design of control systems.
• Ability to work individually and in groups.

Credits: 16
Prerequisite: CEMI326
Assessment modes: PC 3 hours 1:1

Module code: CEMI418 | Semester 1 | NQF level: 8
Name: Ore Dressing

Module objective: Ore dressing comprises the first steps during the preparation and concentration of mined ore. In this module all these processes are studied in terms of the fundamental principles and their operation, simulation and design.

Module outcomes:
After successful completion of this module, the student should have:

Knowledge:
• The principles of the synthesis and design of mineral plants.
• The processes of liberation and concentration of important minerals.
• The types units in the above-mentioned processes and their operation.
• Coal processing and plants.

Skills:
• To integrate and apply the principles of separation equilibrium and kinetics to mineral processes.
• To simulate mineral plants and the associated process units with the help of available computer packages.
• To use the principles of ore commination and mineral liberation to design crushing circuits.
• To use the principles of mineral separation to design concentration processes.
• To safely use laboratory equipment during practicals.
• To be able to function effectively in groups.
• To communicate scientifically in different mediums.

Credits: 16
Prerequisite: None
Assessment modes: PC 3 hours 1:1

Module code: CEMI419 | Semester 1 | NQF level: 8
Name: Pyro metallurgy

Module objective: To give the student basic knowledge and insight of selected aspects of pyro metallurgical processes, including thermodynamic principles, refractories, furnaces and pyrometry. To understand high temperature separation techniques and to apply these in industrial applications.

Module outcomes:
After successful completion of this module, the student should have

Knowledge:
• Understand metallurgical thermodynamic principles used in pyro metallurgical processes.
• Refractories.
• Furnaces and their construction.

Skills:
• Able to use the Laws of Thermodynamics on relevant pyro metallurgical problems.
• Able to use Ellingham-diagrams to make predictions on pyro metallurgical plant operations.
• Distinguish between oxide/ non-oxide and acid/basic/neutral refractories and construct simple phase diagrams for the most important refractories.
• Determine from the phase diagrams plant conditions of the refractories.
• Discuss the classification principles of refractories.
• Perform combustion calculations used in pyro metallurgical processes.
• Distinguish between chemical and physical preparation processes.
• Understand direct reduction of hematite and solve relevant problems.
- Understand copper metallurgy and conduct relevant discussions and solve problems.
- Describe the reduction of solid oxide ores and perform calculations.
- Discuss the carbothermic reduction of Ferro alloys.
- Describe the reduction of alumina.
- Determine chemical equations and solve problems.
- Give a short description of refining processes.
- Perform a research project on a relevant pyro metallurgical process.

**Credits:** 16  
**Prerequisite:** None  
**Assessment modes:** PC 3 hours 1:1

### Vacation Training seniors

**Module code:** CEMI471  
**Year module**  
**NQF level:** 8  
**Name:** Vacation Training seniors  

This is a compulsory attendance module for a period of six weeks during the vacation.

**Module objective:** During vacation training students are exposed to the daily operation of an appropriate plant, installation or laboratory. Typical engineering problems which are connected with the work place concerned must be investigated under the guidance of an engineer in charge.  

**Module outcomes:**  
After successful completion of the module the student should have a better understanding of the skills a professional engineer needs, the process of engineering and problem solving. The student should be able to take his/her place in industry and apply safety requirements in the work place. An occupational safety course (NOSA) will be completed during the second year of study at the University before, the start of the vacation training in industry.

**Credits:** 8  
**Prerequisite:** Must have completed third year  
**Assessment modes:** Attendance (Industry: report)

### Plant Design II

**Module code:** CEMI477  
**Semester 2**  
**NQF level:** 8  
**Name:** Plant Design II  

**Module objective:** To integrate all previous knowledge, together with innovation and creativity to conceptualise and design a technically and economically viable process to produce a valuable commodity from raw materials, while maintaining awareness of the impact of the process on people and the environment.

**Module outcomes:**  
After successful completion of this module, students should have the ability to perform the following:

**Skills:**
- Design a technically and economically viable process plant.
- Effectively communicate in writing and orally the designed process plant as well as all aspects related to the process by which the plant was designed.
- Critically assess the impact of engineering activities on the social, industrial and physical environment.
- Effectively work as an individual in teams and in multidisciplinary environments.

**Note:** Previously CEMI416 + CEMI427

**Credits:** 32  
**Prerequisite:** A student must have completed all previous modules for this programme and must be able to graduate after successful completion of this module

**Assessment methods and weights:**  
- Final design report: 56%;  
- Panel interview: 14%;  
- Preliminary reports: 30%

### Project

**Module code:** CEMI479  
**Year course**  
**NQF level:** 8  
**Name:** Project  

**Module objective:** The aim of the final year chemical engineering project is to allow students the opportunity to demonstrate their competency in applying chemical engineering knowledge to the solution of a practical chemical engineering research project.

**Module outcomes:**  
After successful completion of this module, students should have gained the following:
Knowledge:
- Planning of engineering projects.
- Literature surveys.
- Processing and interpretation of results.
- Reporting of results, both written and oral.
- The use of advanced analytical equipment.

Skills:
After successful completion of this module, students should be able to:
- Conceptualize a research problem.
- Conduct a literature survey to obtain the necessary knowledge regarding a specific problem.
- Formulate a hypothesis that can lead to laboratory planning.
- Plan a laboratory investigation according to known research methodologies.
- Obtain the physical apparatus to conduct the investigation.
- To complete the research process.
- Report results by oral presentations and poster presentations.
- Report research results in a written report complying with acceptable levels of style, language and grammar.
- Integrate prior knowledge and skills for problem solving.
- Use advanced analytical equipment.
- Manage project to meet set milestones and complete project on time.

Credits: 28
Prerequisite: A student must have completed all previous modules for this programme and must be able to graduate after successful completion of this module.

Assessment methods and weights:
Project report: 80%
Oral and poster presentation: 20%

Module code: CHEM111  Semester 1  NQF level: 5
Name: Introductory Inorganic and Physical Chemistry

Module outcomes:
On completing the module the student should be able:
- to demonstrate fundamental knowledge and insight into the properties of matter and compounds, molecular interaction, aqueous solutions, chemical equilibriums, acids and bases, formation of precipitates and electron transfer reactions and to apply this knowledge to write and name chemical formulae;
- to balance reaction equations, to use stoichiometric and other calculations to determine an unknown quantity, and to explain tendencies and relationships according to the Periodic Table (main groups);
- to demonstrate skills in applying laboratory and safety regulations;
- to be competent to explain observed chemical phenomena, do calculations relating to these, communicate results scientifically and to understand applications of these in industry and the environment better.

Module code: CHEM121  Semester 2  NQF level: 5
Name: Introductory Organic Chemistry

Module outcomes:
On completing the module the student should be able:
- to demonstrate knowledge and insight to classify and name organic compounds;
- to know the physical properties and chemical reactions of unsaturated carbohydrates, alkyl halides, alcohols, carbonyl compounds, carboxylic acids and their derivatives, as well as a few aromatic compounds and
- to describe the mechanism of selected organic reactions.

Module code: CHEN211  Semester 1  NQF level: 6
Name: Analytical Methods II

Module outcomes:
At the end of this module the student will have acquired knowledge and insight to describe analysis as a process (sampling, sample preparation, separation, quantifying, evaluating) to
evaluate analytical data, to do analytical calculations and to describe gravimetric methods, volumetric methods (acid-base, compleximetric), atomic spectrometric methods (atomic absorption and emission spectroscopy, inductively coupled plasma), surface characterising methods (microscopy) and separation methods (extraction, column and thin-layer chromatography). The student will also have become familiar with general laboratory techniques and chemical analytical techniques with a view to quality control and control laboratories, and have developed the ability to learn ‘classical’ analytical methods him-/herself, to conduct chemical analyses in a responsible way and to evaluate analytical results.

Module code: CHEN223  |  Semester 2  |  NQF level: 6
Name: Organic Chemistry II

Module outcomes:
Knowledge
At the end of this module the student will be familiar with:
- the basic principles and rules of aromaticity;
- drawing resonance and chemical structures;
- identifying permanent and temporary effects and applying them to predict the sequel of reactions;
- the principles of electrophilic and nucleophilic aromatic substitution reactions with special reference to orientation, reactivity and mechanism;
- illustrating general and name reactions of aromatic and heterocyclic compounds with appropriate examples and mechanisms;
- suggesting synthesis routes for preparing specific aromatic compounds.

Skills
At the end of this module the student will be familiar with:
- setting up appropriate glass apparatus;
- the correct and safe handling of chemicals;
- the dangers of chemicals;
- making scientific observations during experiments and noting these down in the correct way;
- obtaining pure compounds at the end of a synthesis;
- the theoretical background of the experiments;
- laboratory techniques and skills;
- doing appropriate scientific calculations and completing an experimental report.

Module code: EEII321  |  Semester 2  |  NQF level: 7
Name: Power Systems I

Module objective: To obtain a thorough understanding of the basic principles governing single-phase and three-phase power systems and the analytical techniques required for modelling and analysis of power systems under steady state conditions.

Module outcomes:
To successfully complete this module, the student should demonstrate that he/she
- Has mastered the basic principles of single frequency power definitions for both single- and three-phase power systems, application of the admittance matrix, transformer principles and modelling, the per unit system, symmetrical components, steady state transmission line operation and modelling; and
- Can analyse power systems under steady state conditions.

Credits: 16
Prerequisite: EERI221 and EERI311
Assessment modes: PC 3 hours 1:1

Module code: EEII327  |  Semester 2  |  NQF level: 7
Name: Electrical Design

Module objective: This module introduces the systems engineering process. A customised version of this process is applied to a complex engineering problem. Due to the scope and complexity of engineering problems, a high degree of teamwork is required.

Module outcomes:
To successfully complete this module, the student should demonstrate that he/she
- Understands the systems engineering process;
- Can apply design guidelines and constraints;
- Can interpret a development specification and the allocation of requirement;
- Apply a customised systems engineering process on a complex engineering project;
- Can successfully work as an individual and in groups;
- Use appropriate CAD, simulation and other relevant engineering software tools during the design process.

Credits: 16
Prerequisite: Student must be able to complete third year BEng

Assessment modes:
- Functional demonstration of developed solution – Subminimum 50% (40%)
- Design portfolio (40%)
- Oral design presentation (20%)

Module code: EEII413  Semester 2  NQF level: 8

Name: Power Electronics

Module objective: In this module the student is exposed to the different types of power electronic switches and converter topologies. Armed with this knowledge and skills acquired in this and previous modules the student will be able to analyse, design, construct and test power converter circuits for various applications and topologies.

Module outcomes:
To successfully complete this module, the student should demonstrate that he/she
- has mastered the functioning of various power electronic switches, including diodes, transistors, MOSFETs, thyristors and IGBTs, and of various converter topologies;
- understands the physics and switching transients of different switches;
- can calculate the losses associated with different switches;
- can apply switches in various converter topologies; and
- successfully build a converter to control an electrical machine.

Credits: 16
Prerequisite: EERI311 and EERI321

Assessment modes: PC 3 hours 1:1

Module code: EEII422  Semester 1  NQF level: 8

Name: Power Systems II

Module objective: The student acquires the knowledge and skills to analyse power flow in a power system, fault currents and transient stability and how to economically dispatch energy within the power system.

Module outcomes:
To successfully complete this module, the student should demonstrate that he/she
- understands the principles and requirements to operate a power system safely and economically within stable limits;
- can solve power flow problems with Jacobi, Gauss-Seidel and Newton methods;
- can perform symmetrical and asymmetrical fault current analysis;
- can use the swing equation and equal area technique to test the stability of the network;
- can use the principles of generator voltage control, load frequency control and economic dispatch to meet the system requirements; and
- can calculate wave propagation in transmission systems.

Credits: 16
Prerequisite: EEII321

Assessment modes: PC 3 hours 1:1

Module code: EERI212  Semester 1  NQF level: 6

Name: Electrotechnics

Module objective: This course is an introduction to the electrical and electronic engineering. The student should develop basic knowledge with regard to electrical quantities and signals, networks, solution of networks, ac theory and power.

Module outcomes:
To successfully complete this module, the student should demonstrate that he/she
- has acquired thorough knowledge of electrical quantities and components, signals and
understands the basic techniques governing circuit analysis;

- understands the most common network elements and their properties, as well as the application and functioning of these elements in dc and ac networks;
- has developed technical skills to analyse electrical networks in steady state dc and ac conditions using different techniques, phasors and to do power calculations; and
- has developed skills to perform simulations of electrical networks with circuit analysis software.

**NOTE:** This module is taken by Mechanical and Industrial Engineering students.

**Credits:** 16

**Prerequisite:** FSKS111; FSKS121; WISN111 and WISN121

**Assessment modes:** PC 3 hours 1:1

**Module code:** EERI213  |  **Semester:** 1  |  **NQF level:** 6

**Name:** Electrotechnics II

**Module objective:** This course is an introduction to the electrical and electronic engineering. The student should develop basic knowledge with regard to electrical quantities and signals, networks, solution of networks, ac theory and power.

**Module outcomes:**

To successfully complete this module, the student should demonstrate that he/she

- has acquired thorough knowledge of electrical quantities and components, signals and understands the basic techniques governing circuit analysis;
- understands the most common network elements and their properties, as well as the application and functioning of these elements in dc and ac networks;
- has developed technical skills to analyse electrical networks in steady state dc and ac conditions using different techniques, phasors and to do power calculations; and
- has developed skills to perform simulations of electrical networks with circuit analysis software.

**Note:** New module from 2011 for Electrical, Electronic, Computer and Electromechanical engineering students.

**Credits:** 16

**Prerequisite:** FSKS111; FSKS121; WISN111 and WISN121

**Assessment modes:** PC 3 hours 1:1

**Module code:** EERI221  |  **Semester:** 2  |  **NQF level:** 6

**Name:** Electrical Systems I

**Module objective:** This course serves as an introduction to electrical engineering. The laws of electromechanics are applied in the derivation of models for direct current machines. The focus lies on steady state conditions. The student is able to represent 3-phase power, is knowledgeable in power principles and equipped to use phasor diagrams.

**Module outcomes:**

To successfully complete this module, the student should demonstrate that he/she

- has acquired a thorough knowledge of basic units and derived units, the per unit system of measurement and the fundamental principles of electricity and mechanics, electrical network principles and active, reactive and complex power in single- and three-phase linear networks in the steady state;
- has skills to use per unit values to do calculations, and
- can use electrical network theory and circuit laws to analyse the operation of machines under steady state conditions and derive mathematical models for them. The student should also be able to analyse the steady state operation of single- and three-phase networks mathematically.

**Credits:** 16

**Prerequisite:** EERI213

**Assessment modes:** PC 3 hours 1:1

</table>
• can determine the characteristics of different approximation functions for filter designs and apply techniques to practically implement the approximation functions;
• has the ability to design active analogue filters using different methods and implement the designs in different ways using Bode diagrams and other techniques.

Note: New module from 2015 previously EERI229.

Credits: 12
Prerequisite: EERI213 and WISN212.
Co-required: WISN227/WISN222
Assessment modes: PC 3 hours 1:1

Module code: EERI228 Semester 2 NQF level: 6
Name: Measure and Control

Module objective: To acquaint mechanical engineering students with basic instrumentation and control systems and electrical drive systems.

Module outcomes:
After completion of this module the student should be able to
• demonstrate a thorough knowledge of the design and building of basic instrumentation and control systems for process control;
• analyse the behaviour of induction motors;
• specify motors for mechanical applications;
• demonstrate skills in the designing and building of basic instrumentation and control systems;
• demonstrate skills in problem solving, teamwork and communication.

Credits: 16
Prerequisite: EERI212 or EERI213
Assessment modes: PC 3 hours 1:1

Module code: EERI311 Semester 1 NQF level: 7
Name: Electrical Systems II

Module objective: In this module the student is introduced to ac machines and transformers. Armed with this knowledge and skills acquired in this and previous modules, the student should be able to analyse the performance of these electromagnetic converters.

Module outcomes:
To successfully complete this module, the student should be able to demonstrate that he/she
• has acquired a commanding ability to analyse the performance of electromagnetic converters, i.e. transformers, induction motors and synchronous machines; and
• understands and can apply the physics and theory of transformers, induction motors and synchronous machines in practical applications using complex algebra.

Credits: 16
Prerequisite: EERI213, EERI221
Assessment modes: PC 3 hours 1:1

Module code: EERI313 Semester 1 NQF level: 7
Name: Electromagnetics

Module objective: After successful completion of this module the student should be able to apply the principles of transmission and reflection of electromagnetic waves in waveguide applications, to model transmission lines and waveguides as electrical components, to calculate the radiation patterns of antennas and to calculate the electrical and magnetic fields in various applications. The student should further be able to set up and solve electromagnetic problems numerically, thus being able to use computer packages to solve electromagnetic problems.

Module outcomes:
To successfully complete this module, the student should demonstrate that he/she
• has a thorough knowledge of the principles of transmission and reflection of electromagnetic waves, waveguides, the modelling of transmission lines and waveguides as electrical components, the radiation patterns of antennas and the electrical and magnetic fields in various applications;
• can use the acquired knowledge to model and analyse waveguides, radiation patterns of antennas, and to calculate the electrical and magnetic fields in various applications; and
• can set up and solve electromagnetic problems numerically, thus being able to use computer...
packages to solve these problems.

<th>NQF level: 7</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name: Signal Theory II</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Module objective:** The purpose of the Signal Theory II module is to teach the student the basic principles of digital signal theory. The differences between analogue signal theory and digital signal theory are discussed throughout the course as well as the advantages and disadvantages of digital signal theory. At the end of the course the student will be able to analyse basic digital signal processing systems.

**Module outcomes:**
In this module the student obtains the ability to analyse discrete time systems, to mathematically formulate the relationship between discrete time systems and analogue systems and to realize discrete time systems using different methods. The student also learns how to handle discrete time systems using Fourier transform. In the practicum sessions industry problems are addressed and solved using digital signal processing principles.

Credits: 16
Prerequisite: EERI222

<tbody>
<tr>
<td><strong>Name: Control Theory I</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Module objective:** Control Theory I is the basic course in control theory where the student integrates knowledge gained in previous subjects to analyse, design and simulate system behaviour in the continuous time domain.

**Module outcomes:**
To successfully complete this module, the student should demonstrate that he/she
- has mastered the main elements of modern analogue control system theory, i.e. model control system components, determine steady state errors and dynamic response, perform stability analyses, frequency response representations, controller design and simulate, state space modelling of systems;
- can set up block diagrams of systems, model systems, determine steady state errors and dynamic responses; and
- can perform stability analyses with Routh-Hurwitz and root-locus methods, perform frequency response representations using Bode diagrams and others, verify system response through simulation, model systems through state space representation.

Credits: 16
Prerequisite: TGWN121; EERI212/213; TGWN212/TGWN213; TGWN222/TGWN223 and WISN212
Assessment modes: PC 3 hours 1:1

<th>NQF level: 7</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name: Electronics II</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Module objective:** The student should be able to demonstrate a thorough knowledge of electronic hardware after the successful completion of EERI322. The student should also be able to use these obtained skills in creating effective, purpose-driven designs. In addition the student should be able to approach all practice-aimed applications in a problem-solving and analytical manner and cooperate in finding solutions successfully in groups and professional relations, and communicate them orally and in writing.

**Module outcomes:**
To successfully complete this module, the student should demonstrate that he/she
- knows advanced standard configurations of active components;
- is capable of analysing and designing feedback, multistage and power amplifiers as integrated circuits;
- has the capability to determine the frequency and time response of electronic circuits;
- can manipulate signal descriptions in an orthogonal space, with specific reference to signals.
in the frequency domain; and
- can use modulation techniques for the design and analysis of information channels for transfer of analogue or digital information.

### Electronics III

**Module objective:** The aim of this module is to enable the student to analyse and design radio frequency analogue electronic circuits. This module also serves as a study of radio frequency electronic amplifiers, and the stability and noise that accompanies circuits.

**Module outcomes:**
To successfully complete this module, the student should demonstrate that he/she
- understands basics of micro strip waveguides at radio frequencies;
- can use different methods to analyse and design stable analogue radio frequency amplifiers (specifically linear, quasi-linear and nonlinear amplifiers) and lossless impedance matching networks with the aid of the Smith chart;
- can analyse stability and noise in radio frequency amplifiers;
- understands orthogonality, amplitude modulation, frequency modulation, phase modulation, pulse amplitude modulation, pulse width modulation, pulse position modulation and the influence of noise in analogue communication systems; and
- understands digital communication, e.g. ASK, PSK, QAM with reference to the influence of noise and the necessity of error correction.

### Signal Theory III

**Module objective:** The purpose of the Signal Theory III module is to teach the student advanced principles of digital signal theory. The basics of digital filters are discussed throughout the course and at the end of the course the student will be able to design IIR and FIR digital filters.

**Module outcomes**
- In this module the student obtains the ability to handle discrete-time systems in the z-domain, to work with discrete-time systems in the transform domain and to understand digital filter structures.

The student also learns to design IIR and FIR digital filters. In the practicum sessions industry problems are addressed and solved using digital signal processing principles.

**NOTE:** New module from 2016. Previous code EERI413.

### Control Theory II

**Module objective:** This module is a specialist module that follows on the basic level of the third year of study. The focus of the module is on time discrete systems. After successful completion of the module, the student should be able to analyse, design and simulate basic time discrete systems. A short overview of artificial neural networks and fuzzy logic systems is also given.

**Module outcomes:**
To successfully complete this module, the student should demonstrate that he/she can
- design state variable feedback systems, set up mathematical models of simple linear systems;
- apply the z-transform and inverse z-transform, apply and describe sampling and reconstruction;
- determine the pulse transfer functions for open-loop and closed-loop systems;
- determine the time-response characteristics of open-loop and closed-loop systems;
- determine the stability of digital systems;
- describe the operation and application of artificial neural networks and fuzzy logic systems;
- design digital controllers according to predetermined criteria;
- analyse the impact of engineering activities on the community and the environment; and
- complete tasks or projects in group context.

Credits: 16

</table>

Name: Telecommunication systems

Module objective: To provide the student with an overview of the most important aspects of modern speech and data communication systems. Radio and optical communication networks must be defined, designed, analysed, and evaluated from a systems perspective.

Module outcomes:
To successfully complete this module, the student should demonstrate that he/she
- understands the basic principles on which radio and optical communication systems operate;
- is able to compare and evaluate different radio and optical communication systems;
- is able to characterise, analyse, and design radio-based communication systems, including cellular systems, receivers and transmitters, mixers, phase-locked loops and frequency synthesizers; and
- able to analyse optical networks.

Credits: 16
Prerequisite: EERI313
Assessment modes: PC 3 hours 1:1

<table>
<thead>
<tr>
<th>Module code: EERI474</th>
<th>Year module</th>
<th>NQF level: 8</th>
</tr>
</thead>
</table>

Name: Project

Module objective: This module serves as part two of the final year capstone project. The aim of the project module is to lead the student solve a comprehensive practical engineering problem. Through the demonstrations, presentations, and written reports the student have to demonstrate their competence in the following:
- Problem solving
- Engineering design and synthesis
- Professional and technical communication
- Individual working ability
- Independent learning ability
- Engineering professionalism

Module outcomes:
To successfully complete this module, the student should demonstrate that he/she
- Demonstrate adherence to an Engineering Design process;
- Can realise the detail design aspects of their assigned project;
- Can implement and test the functionality of the developed solution;
- Evaluate the suitability of the developed solution;
- Can successfully present the developed solution to a panel;
- Can document the design, testing and evaluation of the solution; and
- Can demonstrate the functionality of the solution to a panel.

Credits: 8
Prerequisite: Student must be able to complete their degree concurrently with EERI474.
Co-required: EERI473
Assessment modes:
Final design report evaluated by both internal and external examiners –Subminimum 50% (75%)
Demonstration of functional solution to a panel of internal and external examiners –Subminimum
Module code: EERI471  |  Semester 2  |  NQF level: 8
Name: Vacation training seniors

Module objective: This is a compulsory attendance module requiring vacation training for a period of six weeks during the University vacation. During this training period students are exposed to the day to day operation of an acceptable plant, installation or laboratory.

Typical engineering problems arising from the activities of the workplace concerned have to be investigated by the student, under the supervision of the engineer in charge.

Module outcomes:
After successful completion of this module, the students should have insight in the skills required of professional engineers, better understand the process of engineering and problem solving, pull their weight in industry and be able to apply safety measures in the work environment.

Credits: 8
Prerequisite: Must have completed third year
Assessment modes: Participation (industries, report)

Module code: EERI473  |  Year module  |  NQF level: 8
Name: Engineering Management

Module objective: To equip students with knowledge and practical project management skills for application in a technical environment.

Module outcomes:
After successful completion of this module, the student should be able to
- have fundamental knowledge of project management activities for all project management functions during each life cycle phase; and
- be able to execute activities of project management in the management of his/her own final year project by using techniques which include development and updating of applicable documentation, as well as using applicable software.

NOTE: Previous codes EERI472 and INGM472.

Credits: 8
Prerequisite: Student must be able to complete their degree concurrently with final year project.
Co-required: Co-required: EERI474 or INGB479 or INGM479 or NUCI479
Assessment modes: PC 3 hours 1:1

Module code: FIAP172  |  Year module  |  NQF level: 5
Name: Professional Practice I

Module outcomes:
On successful completion of this module a student must be able:

Knowledge:
- to demonstrate fundamental knowledge of the work engineers perform in the various disciplines, as well as the curriculum to be followed;
- to demonstrate fundamental knowledge and the application of:
  a) the principles and theory of project management;
  b) the principles and theory of systems engineering;
  c) computer programmes such as Word, Excel and Power Point;
  d) learning, listening, reading and writing strategies; as well as
  e) the academic language register and the reading and writing of academic texts in the field of engineering.

Skills:
- The student must demonstrate the ability to apply, as a member of a multi-disciplinary team, the engineering process of determination of need, analysis, design, manufacture and evaluation to a simple engineering problem or project; to effectively and verbally communicate the engineering process in an ethically responsible way within the academic milieu and to demonstrate the ability to source scientific information within the field of engineering, to analyse texts, interpret them, synthesise, evaluate and to communicate solutions in a creative manner in the applicable academic genres by using linguistic and
mathematical conventions as applicable to the field of engineering.

**Module code:** FSKS111  |  **Semester 1**  |  **NQF level:** 5  

**Name:** Mechanics, Oscillations, Waves and Theory of Heat  

**Module outcomes:**  

**Knowledge:**  
At the end of this module, students will have formal mathematical knowledge of fundamental concepts like force, work, energy and momentum, elasticity, simple harmonic motion, waves, hydrostatics, hydrodynamics and theory of heat.  

**Skills:**  
For the first time, students are introduced to differential and integral calculus in natural science problems, and using these, they will have the skills at the end of the module to describe certain sections of the theory and to solve a variety of problems of the above-mentioned topics. In the accompanying practical sessions, students develop skills in measuring, processing and reporting natural science processes selected from an area wider than Physics only.  

**Module code:** FSKS121  |  **Semester 2**  |  **NQF level:** 5  

**Name:** Electricity, Magnetism, Optics, Atomic and Nuclear Physics  

**Module outcomes:**  

**Knowledge:**  
Students acquire a formal mathematical knowledge of electricity and magnetism, optics and topics from atomic and nuclear physics, such as introductory quantum theory, quantum theory of radiation, atomic spectra, X-rays, de Broglie waves and radioactivity.  

**Skills:**  
Students develop skills to describe physical processes and natural science problems by means of differential and integral calculus and to solve a variety of problems of the above-mentioned topics. In the accompanying practical sessions, they develop their skills in measuring, processing and reporting on natural science processes.  

**Module code:** FSKS211  |  **Semester 1**  |  **NQF level:** 6  

**Name:** Electricity and Magnetism  

**Module outcomes:**  

**Knowledge:** At the end of this module, the students have been introduced comprehensively to the experimental laws of electrostatics and magneto statics in vacuum and matter, and to introductory electrodynamics.
**Skills:** Students learn to apply the laws to a variety of problems by calculating electrostatic potentials and fields and magneto static fields. In the practical sessions, they apply new knowledge to measure some of these phenomena, to investigate the laws governing them and to analyse and present their results and reports by means of computer methods.

**Module objective:** The objective of this module is to equip the student with techniques, tools and approaches to enable the documentation of a process as first steps of system optimization.

**Module outcomes:**
After successful completion of this module the student should be able to:
- Appreciate the role of the Industrial Engineer as process and system optimizer;
- Describe and measure any process in terms of process inputs, process transformation and process outputs;
- Select amongst work study and other process optimization methodologies an appropriate methodology for a given problem;
- Execute the first step of process optimization by documenting the process, within context of the relevant methodology;
- Interpret, create and communicate through a variety of process drawings;
- Use work measurement techniques to determine standard process times;

After successful completion of this module the student should be able to:
- Formulate and solve the optimization problems listed below as deterministic linear programming problems:
  - Linear programming problems;
  - Integer programming problems;
  - Network and transportation problems.
- Determine the sensitivity of a LP problem solution and base decisions upon that
- Follow the problem solving process in the identification, description, formulation and solution of a real-life problem, which can be considered as one of the above. This includes the comparison of alternatives and making of suggestions.

**NOTE:** New module from 2017.

**Credits:** 8
**Prerequisite:** EERI214/REII211 and WISN212
**Assessment modes:** PC 3 hours 1:1

| **Name:** Engineering Economics
**Module objective:** Engineering Economics involves the formulation, estimation and evaluation of economic outcomes of alternatives to accomplish a defined purpose.

**Module outcomes:**
After successful completion of this module the student should be able to:
- Interpret financial statements;
- Use basic accounting equations and financial ratios to describe the financial position of a business;
- Understand the concepts of time value of money, discounted cash flows, inflation, depreciation, depletion, present worth, annual worth, Internal rate of return, external rate of return, investment balance diagrams;
- Perform appropriate calculations and analyses with respect to above, including sensitivity analyses;
- Communicate recommendations.

**Credits:** 16

| **Name:** Operational Excellence
**Module objective:** Operational Excellence is the philosophy of the workplace where problem-solving, teamwork, and leadership results in the ongoing improvement of an organization. The objective of this module is to equip the student to execute the first step of process optimization.

**Module outcomes:**
After successful completion of this module the student should be able to:
- Know and appreciate the underpinning methodologies of operational excellence, namely lean manufacturing, six sigma and scientific management.
- Apply appropriate tools, techniques, theories and models to accomplish operational excellence.

**Credits:** 16
**Prerequisite:** INGB222

• Understand the factors influencing facility location.
• Understand the importance of systematic planning and continuous redesign of facility requirements.
• Understand material handling principles.
• Know alternative material handling systems.
• Understand interactions among humans and work environment (ergonomics).
• Apply theory, principles, data and methods to design facilities in order to optimize human well-being and overall system performance.
• Evaluate product, process and schedule design and impact on facility requirements
• Determine capacity requirements.
• Apply best practices of efficient flow planning, work station design, materials handling system design, visual management.
• Identify and compare alternative production systems, layout types and materials handling systems for a given problem.
• Use algorithms to optimise flow and layouts.

Credits: 16
Prerequisite: Student must be final year and must be able to complete the degree
Assessment modes: Design report and written exam

Module code: INGB421  Semester 2  NQF level: 8
Name: Business Analytics

Module objectives: To familiarize the student to business analytics concepts, principles and techniques, and to solve practical problems through relevant case studies. This will include descriptive, predictive and prescriptive methods, as well as the processes to be followed when applying business analytics within an organizational context.

Module outcomes: After successful completion of this module the student should be able to:
• Know and understand business analytics concepts: decision making processes; analytics data and technology; descriptive, predictive and prescriptive analytics, including modelling and optimization.
• Analyse problems to be solved through business analytics, the management of analytics data, the use of analytics software and the application of software tools to practical problems.

Credits: 16
Prerequisite: ITRW325, TGWN322 and REII415/REII414
Assessment modes:

Module code: INGB427  Semester 2  NQF level: 8
Name: Business Engineering and Design

Module objectives: To familiarise the student with the complex and interdisciplinary world of business from an engineering point of view. This module also enhances the student’s engineering design skills by way of application to real world business problems. The concepts mastered in this course will allow the student to develop entrepreneurial thoughts before entering the work environment.

Module outcomes: After successful completion of this module the student should be able to:
• Know and understand of business engineering concepts: Business process engineering (BPR), servitization, entrepreneurship, intrapreneurship, business models, value propositions, customer behaviour, system architecture and how they interrelate.
• Use BPR to map existing and improved business processes
• Identify and develop value offerings
• Identify applications areas for engineering knowledge in the business environment
• Conceptualize business architecture
• Model existing business processes using BPR and recommend improvements
• Identify potential problem areas within business processes
• Recognize different business models and value propositions in their day to day encounters.

**NOTE:** New module from 2017.

**Credits:** 16

**Prerequisite:** Student must be final year (must be able to complete the programme)

**Assessment modes:** Design report and written exam

**Module code:** INGB471  |  **Semester 2**  |  **NQF level:** 8

**Name:** Vacation training seniors

**Module objective:** This is a compulsory attendance module requiring vacation training for a period of six weeks during the University vacation. During this training period students are exposed to the day to day operation of an acceptable plant, installation or laboratory.

Typical engineering problems arising from the activities of the workplace concerned have to be investigated by the student, under the supervision of the engineer in charge.

**Module outcomes:**
After successful completion of this module, the students should have insight in the skills required of professional engineers, better understand the process of engineering and problem solving, pull their weight in industry and be able to apply safety measures in the work environment.

**Credits:** 8

**Prerequisite:** Must have completed third year

**Assessment modes:** Participation (industries, report)

**Module code:** INGB479  |  **Year module**  |  **NQF level:** 8

**Name:** Project

**Module objective:** To teach the student to execute a project with help from a study leader and to report it both orally and in writing. The project has both a theoretical and practical component, e.g. design and testing. The student is given an opportunity to integrate his/her knowledge and skills in various engineering subjects into one comprehensive project.

**Module outcomes:**
After successful completion of this module, the student should be able to
• define the problem and divide it into smaller problems;
• synthesize, analyse and evaluate the possible solutions;
• document the design or experimental procedures;
• fabricate the design or experimental hardware;
• test aspects of the design, evaluate the design or to do the experiments;
• collect information through the library and/or internet;
• report on the project both verbally and in writing; and
• use project management software to manage progress on the project.

**Credits:** 40

**Prerequisite:** Student must be final year (must be able to complete the programme)

**Co-required:** EERI473

**Assessment modes:** Successful reporting on an engineering project, in the form of a written report, an oral presentation and a poster presentation.

**Module code:** INGM111  |  **Semester 1**  |  **NQF level:** 5

**Name:** Engineering Graphics I

**Module objective:** To equip the student to communicate with basic engineering graphics and to create drawings by means of hand sketching and computer aided design software. The student should have an understanding of the role of engineering graphics in further design modules and in practical design processes.

**Module outcomes:**
After successful completion of this module, the student should be able to
• make use of basic geometric forms to create and communicate design solutions;
• create technical design solutions by using sketching and CAD; and
• communicate in e-format.

**Credits:** 12

**Prerequisite:** none
### Module code: INGM121  |  Semester 2  |  NQF level: 5
---
**Name:** Engineering Graphics II  
**Module objective:** To equip the student to communicate through advanced mechanical engineering graphics and to create specialised mechanical drawings. The student should have an understanding of the role of engineering graphics in practical design analysis and in further design modules. The student should acquire the skills to operate in a group by solving design problems and perform project administration in e-format.

**Module outcomes:**  
After successful completion of this module, the student should be able to  
- create 3D models of parts and assemblies and create manufacturing and assembly drawings; and  
- work in groups to solve engineering designs; and  
- communicate in e-format.

**Credits:** 12  
**Prerequisite:** INGM111 (40%)  
**Assessment modes:** PC 3 hours 40:60  
**Exam:** 60% (Sub-minimum 40%)  

### Module code: INGM122  |  Semester 2  |  NQF level: 5
---
**Name:** Materials Science I  
**Module objective:** To equip the student with basic knowledge about the composition, structure, properties and applications of engineering materials. This module forms the basis for later modules in materials selection, techniques for manufacturing, strength of materials and design.

**Module outcomes:**  
After successful completion of this module, the student should be able to  
- evaluate the suitability of some important engineering materials for certain applications, based on their properties; and  
- analyse and interpret experimental data in the laboratory.

**Credits:** 16  
**Prerequisite:** none  
**Assessment modes:** PC 3 hours 1:1

### Module code: INGM211  |  Semester 1  |  NQF level: 6
---
**Name:** Strength of Materials I  
**Module objective:** The objective of this module is to give the students a basic knowledge of strength of materials and give them a basic understanding of the analysis and design of mechanical structures. This module forms the basis for Strength of Materials and Mechanical Design in the 3rd year.

**Module outcomes:**  
After successful completion of this module, the student should be able to use the knowledge gained to define and solve problems:  
- Stress: Axial, Shear, Bending, Combined stress condition;  
- Strain;  
- Thin walled pressure vessels;  
- Safety factors;  
- Stress concentrations.

**Credits:** 12  
**Prerequisite:** WISN121 and TGWN121  
**Assessment modes and weights:**  
Tests: 27%; Practical’s 3%; Exam-project: 70% (sub-minimum 50%)

### Module code: INGM212  |  Semester 1  |  NQF level: 6
---
**Name:** Engineering Materials  
**Module objective:** Provision of learning opportunities to acquire an understanding of the influence of chemical composition, strengthening mechanisms and strengthening techniques/methods on strength, ductility, toughness, and formability of ferrous- and non-ferrous alloys, design designations, specifications and the use, and application potential of these materials, in mechanical design.
Differently stated, the student should have developed the ability to perform general material selection for design.

**Module outcomes:**  
After successful completion of this module, the student should be able to:  
- Classify carbon steels, alloys steels, stainless steels, cast irons, tool steels, copper and zinc alloys, Ti-alloys, Ni-alloys, refractory metals and engineering ceramics, in terms of main general composition, phase chemistry where applicable to classification and properties, general engineering properties and general and potential application in engineering design or otherwise.  
- Demonstrate knowledge of the principles and methods that are available to improve engineering properties of ferrous and non-ferrous alloys.  
- To specify materials for simple mechanical designs taking cognisance of the possible influence of requirements with respect to failure, (corrosion) and the impact on the environment.  
- The student will also have been subjected to:  
  1. Basic considerations for material selection;  
  2. Group projects in terms of:  
     - Procedural and non-procedural design;  
     - Synthesis of components & systems;

**Credits:** 12  
**Prerequisite:** INGM122 (40%)  
**Assessment modes:** PC 2 hours 1:1  
**Module code:** INGM222  
**Semester:** 2  
**NQF level:** 6

<table>
<thead>
<tr>
<th>Name: Thermodynamics I</th>
<th></th>
</tr>
</thead>
</table>

**Module objective:** To lead the students to a thorough understanding of the concepts and principles of thermodynamics and lead them to a confident application thereof. The concepts mastered in this module form an integral part of the energy and thermal-fluid modules in subsequent years.

**Module outcomes:**  
After successful completion of this module, students should have the following:  
- Knowledge  
  Knowledge and understanding of thermodynamic concepts: mass and energy conservation, reversible and real processes, properties of real, ideal and perfect substances and how they interrelate.  
- Skills  
  - The ability to solve thermodynamic problems  
  - Tutorials are done cooperatively and students who attended the tutorials should be able to cooperate better with others.

**Credits:** 12  
**Prerequisite:** WISN11  
**Co-required:**  
The student should have passed or be enrolled for WISN 121  
**Assessment methods and weights:**  
Three semester tests: 33%; Practical exam: 7%; and Exams: 60%  
**Module code:** INGM223  
**Semester:** 2  
**NQF level:** 6

<table>
<thead>
<tr>
<th>Name: Manufacturing Technology</th>
<th></th>
</tr>
</thead>
</table>

**Module objective:** The objective of this module is first of all to introduce the student to the different manufacturing technologies available, and to enable the student to specify the correct or applicable manufacturing processes for any mechanical design. The second objective is to enable the student to design for manufacturing i.e. so that the designed component or product can be manufactured as effectively, simple and inexpensive as possible.

**Module outcomes:**  
On successful completion of the module, the student must have basic knowledge of the following:  
- Knowledge  
  - Characteristics and manufacturability properties of engineering materials.  
  - Material-forming manufacturing processes to manufacture components from metals, plastics, composites and ceramics.
**Skills**

- Know and understand the applications and limitations of the different manufacturing processes and be able to apply them successfully to engineering problems related to manufacturing;
- Understand the economic aspects related to manufacturing as well as the impact it has on the design process;
- Be able to apply knowledge with respect to material properties and manufacturing processes and technology to solve industrially oriented problems regarding material forming, manufacturing and value adding processes;
- Be able to suggest suitable testing, inspection, and quality-assurance procedures for application in the manufacture of a specific component;
- Be able to optimise manufacturing processes to manufacture a component more competitively;
- Be able to design components with the emphasis on manufacturability of the component/product;
- Understand the impact of different manufacturing technologies on the environment, workforce and surroundings;
- Understand the dangers and issues relating to the safe use of different manufacturing technologies, and therefore understand the professional responsibility of the manufacturing engineer to conduct manufacturing operations in a responsible and safe manner.

**NOTE:** New module for second year students in 2017. Same module as INGM423.

| Credits: | 12 |
| Prerequisite: | INGM212 or INGB121 |
| Assessment modes: | PC 3 hours 30:70 |

**Module code: INGM224**

**Semester 2**

**NQF level: 6**

**Module objective:**

In industry, engineers work with a variety of computer software that enable them to solve engineering problems. The software can be divided into two main groups, namely thermal flow analysis and strength of materials analysis packages. The object of this module is to expose the student to both types of computer packages that he/she will come across in modules in following years of study, and eventually in industry itself. This module also provides a support function for modules in the third and fourth years of study, where this knowledge and these skills will be required.

**Module outcomes:**

After successful completion of this module, the student should be able to

- identify and interpret thermal flow and strength of materials problems;
- plan and develop simulations and analysis to solve problems;
- write, solve and analyse basic thermal flow programmes using Engineering Equation Solver (EES);
- design and analyse piping networks using Flownex; and
- design and solve basic structural problems using NASTRAN.

| Credits: | 8 |
| Prerequisite: | INGM211 |
| Co-required: | INGM222 |
| Assessment modes: | PC 3 hours 1:1 |

**Module code: INGM271**

**Year module**

**NQF level: 6**

**Module objective:**

The purpose of this module is to provide students instruction in workshop practice and the safe use of tools. Students must master the practical use of basic hand tools and manufacturing
equipment and have acquired basic knowledge of safety requirements in the workshop and the skills to fabricate small articles. The eleven ELO’s of ECSA will also be introduced and discussed.

**Module outcomes:**
After successful completion of this module, students will have mastered the practical use of basic hand tools and manufacturing equipment, e.g. welding machines and various other machine tools. The student will acquire basic knowledge of engineering drawings, safety requirements in the workshop and the skills to fabricate small articles; involving plate metal work, turning, welding, electronics and they will acquire knowledge about electrical circuits and electrical equipment.

**Knowledge**
The student will able to understand workshop safety and the basic understanding of the various machines in the industry and the eleven ELO’s of ECSA.

**Skills**
After completion of this module, the student will have developed the following skills:
- Interpretation and layout of engineering drawings, manufacturing and job scheduling / planning;
- Understand the need of workshop safety;
- Ability to understand the hand tools and real life working experience;
- Ability to select material and do several jointing methods in the engineering environment;
- Fabricate small articles.

**Note:** This is the new code for Mechanical students for the module MEGI271 from 2010.

**Credits:** 8  
**Prerequisite:** none  
Method of delivery: practical training – Participation.

**Module code:** INGM311 | Semester 1 | NQF level: 7

**Name:** Thermodynamics II

**Module objective:** To develop and apply the concepts and principles from the first module in thermodynamics in different applications. This module follows on the first module in thermodynamics and develops it further. It forms part of the foundation of modules such as air-conditioning and thermo-machines.

**Module outcomes:**
After successful completion of the module the student should be able to:
- Analyse power and refrigeration cycles;
- Do an energy analysis on open and closed systems;
- Use variables such as: dry bulb temperature, relative humidity and specific humidity in analysing processes performed on air;
- Apply the First Law on processes performed on air;
- use the Psychrometric Chart in the calculation and analysis of processes performed in the conditioning of air;
- Given the off-gas analysis, fuel composition, air-fuel ratio or other standard specifications, balance the combustion reaction and calculate the energy released (work or power) in combustion reactions; and
- Use thermodynamic relations to calculate the value of internal energy, enthalpy and entropy for components used in thermodynamic systems.

**Credits:** 12  
**Prerequisite:** INGM222

**Assessment methods and weights:**  
Semester test: 3x9%;  
Project group assignments: 3% and  
Exam-project: 70% (Sub-minimum 40%)

**Module code:** INGM312 | Semester 1 | NQF level: 7

**Name:** Fluid Mechanics I

**Module objective:** To provide the student with the basic knowledge of fluid mechanics including the conservation laws for systems and control volumes with the emphasis on incompressible flow in pipes and ducts. This is a first module in fluid mechanics that forms part of the basis for the
follow-on module INGM321 Fluid Mechanics II as well as for the modules in Fluid Machines, Thermal-fluid System Design and Project.

Module outcomes:
After successful completion of this module, students should have the following:

Knowledge
General concepts; Fundamentals of fluid flow analysis; Fundamental laws for systems and control volumes including integral and differential form as well as dimensional analysis; Incompressible viscous flow in pipes and ducts.

Skills
After completion of this module, the student will have developed the following skills:
- Apply the mathematical formulations for velocity, acceleration, mass flow rate and forces to describe the properties of flow fields.
- Apply the equations for the conservation of mass, linear momentum and angular momentum in both integral and differential form to describe and solve practical problems in fluid mechanics.
- Apply dimensional analysis techniques to derive scaling laws for simple experimental studies of fluid mechanics phenomena.
- Calculate the losses that are present in steady-state incompressible flow in pipes and ducts and apply it in the solution of practical pipe network problems and the design of simple pipe systems.

Credits: 12
Prerequisite: none

Assessment methods and weights:
Tests: 1,2,3: 15%; Assignments: 1,2: 9%; Practicums: 1,2: 6%; Examination: 70%

Module code: INGM313 Semester 1 NQF level: 7

Name: Strength of Materials II

Module objective: To equip the student with basic knowledge of the determination of stresses and displacements for the analysis and design of structural components. This module follows on MEGI211 and serves as further preparation for the modules on structural analysis fluid machines and mechanical design.

Module outcomes:
After successful completion of this module, the student should be able to apply fundamental knowledge of:
- Stress and strain transformation;
- Failure criteria;
- Analysis of shaft for failure;
- Deflection of beams;
- Euler struts;
- Energy methods;
- Thick-walled cylinders.

Credits: 12
Prerequisite: INGM211

Assessment methods and weights:
Semester test: 25% (Sub-minimum 50%); Project group assignments: 5%; Exam: 70%

Module code: INGM321 Semester 2 NQF level: 7

Name: Fluid mechanics II

Module objective: To equip the student with the basic knowledge of compressible flow, boundary layer flow, potential flow and measuring techniques in fluid mechanics. This module follows on MEGI 312 Fluid Mechanics I and serves as further preparation for the modules in Heat Transfer and Thermal Fluid System Design.

Module outcomes: Attain engineering science knowledge about a wide variety of fluid mechanics. After successful completion of this module, the student should be able to
- To apply the basic knowledge and principles of compressible flow and boundary layer theory to solve problems.
- Use the applicable engineering tools such as the software package EES.
- Analyse and interpret results obtained from assignments and practical experiments.
### Structural Analysis

**Module objective:** To equip the student with basic knowledge of the flexibility, stiffness and finite element methods. This module follows on INGM313 and serves as support and further preparation for the modules on mechanical design.

**Module outcomes:**
- After successful completion of this module, the student should have the following:
  - **Knowledge**
    - Matrix structural analysis; Weak formulation; Finite element formulation; Finite element solution of one-dimensional second order equations; Finite element solution of one-dimensional fourth order equations; Finite element solution of coupled and constrained one-dimensional equations.
  - **Skills**
    - Identify, formulate and to solve structural problems.
    - Apply specialist knowledge of the flexibility, stiffness and finite element methods to analyse and solve engineering problems.
    - Use the appropriate engineering tools such as EES and a finite element code to simulate engineering problems.

**Assessment methods and weights:**
- Semester test: 22%;
- Tutorials: 6%;
- Assignment 01: 6% (Sub-minimum 40%);
- Assignment 02: 6% (Sub-minimum 40%);
- Exam: 60% (Sub-minimum 40%)

### Machine Design

**Module objective:** To teach the student the basic engineering knowledge of machine design and to give them a basic understanding of the analysis and design of simple machine components. This unit covers some of the basic aspects needed for the subject Mechanical Design.

**Module outcomes:**
- After successful completion of this module, the student shall be able to:
  - Analyse existing designs of basic machine elements: Cams, Crank diagrams, Universal Joints, Governor’s Belt drive systems.
  - Have a basic understanding of oils and lubricants.

**Assessment methods and weights:**
- Semester test: 25%;
- Practical: 5% ;
- Exam-project: 70% (Sub-minimum 40%)

### Mechanical Design

**Module objective:** To teach the student the basic engineering knowledge for the analysis and design of some basic mechanical systems. The mechanical components include fasteners, bearings, gears, shafts and axles. This is a comprehensive module in design of mechanical components that is based on the modules in Drafting for Engineers, Engineering Materials and Strength of Materials. The student has to design a reduction gearbox for use in the Puk-BAJA project.

**Module outcomes:**
- After successful completion of this module, the student shall be able to:
  - Analyse existing designs of basic machine elements;
• Design basic machine elements; and
• Communicate in writing with technical audiences through sketches, drawings and a formal engineering design report.

Credits: 16
Prerequisite: INGM313

Assessment outcomes:
• Analyse and design the basic elements of Machine Design;
• Complete a comprehensive design problem that covers many of the basic elements;
• Compile a manufacturing drawing pack for the comprehensive design problem.

Assessment methods and weights:
Semester test: 20% (Sub-minimum 50%);
Class test: 10%;
Exam-project: 70% (Sub-minimum 50%)

Module code: INGM411 Semester 1 NQF level: 8

Name: Thermal Machines

Module objective: This module will equip the student with the fundamentals in engineering science and applied knowledge of gas turbines and reciprocating internal combustion engines. The design, solution and optimisation criteria of ideal and practical thermodynamic cycles will form the basis of analysis and synthesis in operational performance. The module builds on the knowledge gained in thermodynamics, fluid dynamics, heat transfer and computer methods and forms part of the basis for the final year Project and the Thermo-Fluid System Design module to follow.

Module outcomes:
The knowledge gained will be in the fields of gas turbines and internal combustion engines.
Skills:
The skills learnt will be obtained by applying the fundamental knowledge of gas turbine and reciprocating internal combustion engine theory together with specialised knowledge of thermodynamic cycles, fluid dynamics, heat transfer, and computer programming to solve thermo-machine problems. The design of basic thermo-machine cycles is done by means of convergent and divergent synthesis of existing knowledge. The optimisation in the design of typical gas turbine cycles is done by using programming in Engineering Equation Solver (EES). The analysis and interpretation of experimental data are done during practical sessions.

Credits: 16
Prerequisite: INGM224 (40%); INGM311 (40%) and INGM321 (40%)
Co-required: INGM412 and INGM417

Assessment methods and weights:
Summative exam (Gas turbines) 25%;
Summative exam (Internal Combustion Engines) 25%;
(A sub-minimum of 40% is required for each of the above two exams and 50% combined).
Design assignment including computer programming and cycle optimisation 50%.

Module code: INGM412 Semester 1 NQF level: 8

Name: Heat Transfer

Module objective: To provide the student with the basic knowledge of conduction, convection and thermal radiation. Furthermore develop the necessary skills to solve problems that are generally found in heat transfer processes. This module follows on Fluid Mechanics and is necessary for successfully completing Thermal Fluid System Design.

Module outcomes:
After successful completion of this module, the student should be able to
• apply basic knowledge and concepts of heat transfer, including conduction, external flow, flow inside pipes and thermal radiation to solve practical problems;
• design a basic heat exchanger by integrating the knowledge gained on different heat transfer methods into a solution strategy;
• use engineering software tools like Excel and EES to solve heat transfer problems; and
• analyse and interpret results obtained from practical experiments.

Credits: 12
Prerequisite: INGM321
Assessment modes: PC 3 hours 1:1
# Module code: INGM413  Semester 1  NQF level: 8

**Name:** Fluid Machines  

**Module objective:** At the end of this module the student should have in-depth knowledge of the concepts and theory of fluid machines and be able to select the right fluid machine for different applications and predict the performance of individual fluid machines, as well as in flow networks.  

**Module outcomes:** After successful completion of this module, students should have the following:  

### Knowledge  
Knowledge and be able to understand fundamental fluid machine concepts and definitions, hydraulic pumps, hydraulic turbines, centrifugal compressors and fans, axial flow compressors and fans.  

### Skills  
After completion of this module, the student will have developed the following skills:  
- Choose the right fluid machine for the right application.  
- Predict the performance of a full size fluid machine given the performance of a scale model.  
- Predict the performance of a fluid machine given the geometry of the machine as well as the flow conditions before and after the machine.  
- Predict the performance of fluid machines in basic flow networks.  

**Credits:** 12  
**Prerequisite:** INGM321  
**Assessment methods and weights:**  
- Two tests 70%  
- Two practicums 30%  
- Participation mark 40%  
- Final examination: 60%

---

# Module code: INGM414  Semester 1  NQF level: 8

**Name:** Air conditioning and Refrigeration  

**Module objective:** After completion of this module the student should be able to solve air conditioning and refrigeration problems and design a refrigeration system (by combining a synthesis of knowledge with additional self-obtained information). It includes the use of tools such as Excel, as well as specialist programs such as EES. The student should be able to understand the impact of the air conditioning and refrigeration industry, as a result of the use of harmful refrigeration media and emissions, on the environment and should be able to stay abreast with the latest technology available on the market.  

**Module outcomes:**  
After successful completion of this module, the student should be able to  
- Understand the psychrometric chart and do basic calculation for various actual processes;  
- Understand and calculate the heating load for a building;  
- Understand and solve a compression thermodynamic cycle for air-conditioning system with applicable equipment sizing;  
- Understand and solve air distribution system for a building;  
- Using engineering software tools like Excel and EES and Design Builder to solve problems;  
- Analyse and interpret results obtained from assignments and practical experiments.  

**NOTE:** This module is not offered in 2017.  

**Credits:** 16  
**Prerequisite:** INGM311 and INGM321  
**Assessment modes:** PC 3 hours 1:1

---

# Module code: INGM415  Semester 1  NQF level: 8

**Name:** Failure of Materials  

**Module objective:** Engineers of all disciplines need to have a basic and applied knowledge of the degradation and possible failure mechanisms of structural materials. The module aims to introduce students to failure mechanisms associated with metal alloys, ceramics and polymeric engineering materials with reference to those properties that influence integrity. Special focus is on condition monitoring of machines in factories and mines. The module is presented against the background of specific applications and observed failures of materials under typical service conditions.
Module outcomes:

Knowledge
The student will gain knowledge of the most important failure phenomena and the prevention of failure through suitable design and operation. This knowledge is conveyed during lectures, case studies, and practical investigations of failed components.

Skills
After completion of this module, the student will have developed the following skills:
- Ability to understand the different conditions at specific type of material failures.
- Do computations for fatigue and brittle failures.
- Apply knowledge for vibration analysis and diagnostics of problems at machine for condition monitoring, as predictive maintenance approach.

Credits: 16
Prerequisite: INGM212
Assessment modes: PC 3 hours 1:1

Module code: INGM416 | Semester 1 | NQF level: 8

Name: Aircraft Design

Module objective: The objective of the module is to prepare the student for further in depth study of aerodynamics and aircraft design and give an introduction to the fundamentals of aeronautical engineering.

Module outcomes:
After successful completion of this module, the student should be able to

Knowledge:
- Understand the fundamentals of fluid mechanics, lift, drag, thrust, aircraft performance, stability and control.

Skills:
- Use Xfoil (2D computer software for designing airfoils) to design and optimize airfoils;
- Integrate knowledge of this and other modules to design a basic aircraft, according to specifications.

Credits: 16
Prerequisite: INGM313
Assessment modes: PC 3 hours 40:60

Module code: INGM417 | Semester 1 | NQF level: 8

Name: Systems Engineering

Module objective: To teach the student the basic knowledge of systems engineering and the ability to apply it in the design of practical systems. This is the capstone in the application of the underlying training in engineering drawings, materials, strength of materials and mechanical design. This module develops the design skills of the students and exposes them to group work.

Module outcomes:
After successful completion of this module, the student should be able to

- define a user requirement in engineering terms, do a functional analysis of the system and creatively generate system concepts and evaluate it;
- break a system down into sub-systems and components, assign applicable technical performance measures to it, and design according to the specifications;
- communicate in writing with technical audiences by means of reports; and
- work in a group.

Credits: 12
Prerequisite: None
Co-required: INGM479 or NUCI479
Assessment modes: PC 3 hours 1:1

Module code: INGM421 | Semester 2 | NQF level: 8

Name: Machine Dynamics

Module objective: To equip the student with basic knowledge of machine dynamics, vibration and condition monitoring. The module builds on the knowledge gained in dynamics and serves as a basis to identify and understand typical problems found in practice.

Module outcomes:
After successful completion of this module, the student should be able to:

- Use the flexibility method to determine the unknown reaction forces and the element forces of statically indeterminate structures;
- Use the stiffness method to determine the displacements of statically determinate and indeterminate structures;
- Derive the weak formulation and set-up the associated Galerkin finite element formulation for one-dimensional second order and fourth order differential equations;
- Use the finite element method to determine the approximate solution of one-dimensional second order and fourth order differential equations;
- Communicate effectively and function in a team in the context of the abovementioned problem solving skills that you have developed;
- Reason and act ethically correct based on an established value system.

Credits: 16
Prerequisite: TGWN312
Assessment modes: PC 3 hours 1:1

<table>
<thead>
<tr>
<th>Module code: INGM423</th>
<th>Semester 2</th>
<th>NQF level: 8</th>
</tr>
</thead>
</table>

Name: Manufacturing Technology

Module objective: The objective of this module is first of all to introduce the student to the different manufacturing technologies available, and to enable the student to specify the correct or applicable manufacturing processes for any mechanical design. The second objective is to enable the student to design for manufacturing i.e. so that the designed component or product can be manufactured as effectively, simple and inexpensive as possible.

Module outcomes: On successful completion of the module, the student must have basic knowledge of the following:

Knowledge
- Characteristics and manufacturability properties of engineering materials.
- Material-forming manufacturing processes to manufacture components from metals, plastics, composites and ceramics.
- Material-removal manufacturing processes to manufacture components from different materials.
- Material jointing processes used to join different materials, eg welding, brazing, adhesive bonds, etc.

Skills
- Know and understand the applications and limitations of the different manufacturing processes and be able to apply them successfully to engineering problems related to manufacturing;
- Understand the economic aspects related to manufacturing as well as the impact it has on the design process;
- Be able to apply knowledge with respect to material properties and manufacturing processes and technology to solve industrially oriented problems regarding material forming, manufacturing and value adding processes;
- Be able to suggest suitable testing, inspection, and quality-assurance procedures for application in the manufacture of a specific component;
- Be able to optimise manufacturing processes to manufacture a component more competitively;
- Be able to design components with the emphasis on manufacturability of the component/product;
- Understand the impact of different manufacturing technologies on the environment, workforce and surroundings;
- Understand the dangers and issues relating to the safe use of different manufacturing technologies, and therefore understand the professional responsibility of the manufacturing engineer to conduct manufacturing operations in a responsible and safe manner.

NOTE: Module is the same as INGM223, starting in 2017. INGM423 ends at the end of 2019.

Credits: 12
Prerequisite: INGM212 or INGB121
Assessment modes: PC 3 hours 30:70
Module code: INGM427 | Semester 2 | NQF level: 8
Name: Thermal Fluid System Design

**Module objective:** This module will equip the student with fundamentals in engineering science and applied knowledge of power generation. More specifically, steam turbines and associated auxiliary plant, the design and optimisation of Rankine cycles, steam boilers and the combustion of coal with associated auxiliary plant and the design and optimisation of combustion parameters. Design, solution, and optimisation criteria of ideal and practical Rankine cycles will form the basis of analysis and synthesis of operational performance. The module builds on the knowledge gained in thermodynamics, fluid dynamics, thermo-machines, heat transfer and computer methods.

**Module outcomes:**
After successful completion of this module, a student should have the following:

**Knowledge**
Knowledge in the fields of steam turbines and coal fired boilers.

**Skills**
Be able to:
- Designing a basic Rankine cycle by means of convergent and divergent synthesis of existing knowledge, with emphasis on feed pumping combinations and regenerative feed water heating options.
- Combined cycle principles.
- Boiler operational problems, control system philosophy, clinker formation and sootblowing philosophies.
- Steam boiler auxiliary plant, combustion, and airflow optimisation with coal quality impact factors. Safety precautions, air pollution and impact on society.

**Credits:** 16

**Prerequisites:** INGM411 passed or admittance (>40%): for INGM311, INGM321, INGM412 and INGM417

**Assessment methods and weights:**
- Summative exam (Steam turbines) 25%
- Summative exam (Boiler and combustion) 25%
- Design assignment including computer programming and cycle optimisation 50%

(A sub-minimum of 40% is required for each of the above two exams and 50% combined; a sub-min of 50% is required)

<tbody>
<tr>
<td>Name: Vacation Training seniors</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This is a compulsory attendance module for a period of six weeks during the vacation.

**Module objective:** During vacation training students are exposed to the daily operation of an appropriate plant, installation or laboratory. Typical engineering problems which are connected with the work place concerned must be investigated under the guidance of an engineer in charge.

**Module outcomes:**
After successful completion of the module the student should have a better understanding of the skills a professional engineer needs, the process of engineering and problem solving. The student should be able to take his/her place in industry and apply safety requirements in the work place. An occupational safety course (NOSA) will be completed during the second year of study at the University before, the start of the vacation training in industry.

**Credits:** 8

**Prerequisite:** Must have completed third year

**Assessment modes:** Attendance (Industry: report)

Module code: INGM472 | Year module | NQF level: 8
Name: Introduction to Project Management

**Module objective:** To equip students with knowledge and practical project management skills, for application in a technical and/or industrial environment.

**Module outcomes:**
After successful completion of this module, a student will
- Have a fundamental knowledge of project management activities for all project management
functions during each project life cycle phase.

- Be able to execute activities of project management in the management of his/her own final year project, by using techniques which includes development and updating of applicable documentation as well as using applicable software.
- Be able to compile a useable project management plan pinning all the mentioned project management areas.

**Module objective:** To teach the student to execute a project with help from a study leader and to report it both orally and in writing. The project has both a theoretical and practical component, e.g. design and testing. The student is given an opportunity to integrate his/her knowledge and skills in various engineering subjects into one comprehensive project.

**Module outcomes:**
After successful completion of this module, the student should be able to
- define the problem and divide it into smaller problems;
- synthesize, analyse and evaluate the possible solutions;
- document the design or experimental procedures;
- fabricate the design or experimental hardware;
- test aspects of the design, evaluate the design or to do the experiments;
- collect information through the library and/or internet;
- report on the project both verbally and in writing; and
- use project management software to manage progress on the project.

<tbody>
<tr>
<td>Name: Introduction to Computers and Programming</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Module outcomes:**
On completing this module, the students should be able to demonstrate fundamental knowledge of the different components of a computer and an information system, as well as programming languages and their uses.
Furthermore, the student should be able to demonstrate the manipulation of spreadsheets by applying knowledge of tables, computations, transfer of data between different applications, functions and graphic presentations; to demonstrate the ability to solve problems by designing and implementing structured programming, by using data manipulation and data presentations and applying 'GUI' event-driven approaches in the development environment of a spreadsheet; to demonstrate insight into ethical issues related to the wider IT business and an awareness of the risks and dangers that threaten the business; to demonstrate the ability to communicate in writing by compiling a report after having completed a project.

<td></td>
<td></td>
</tr>
</tbody>
</table>

**Module outcomes:**
On completing this module students should be able to
- demonstrate knowledge requiring the mastering of certain prior theoretical insights to write computer programs;
- solve simple problems by the application of prior theoretical knowledge;
- demonstrate that he/she has sufficient knowledge of and insight into the graphical interface environment to develop computerized systems in a visual object-oriented computer language;
- demonstrate the ability to understand and implement conditional, repetition and sequential structures; and
- have mastered aspects such as graphical interface design, event-driven programming, and procedural programming.

**Assessment criteria:**
The student demonstrates that the outcomes have been mastered if he/she
- can show that he/she can practically apply the theory of graphical interface programming by solving given problems; and
- can facilitate problem solving by the design and development of computer applications with emphasis on user-friendly interfaces.

</tr>
</tbody>
</table>

**Module outcomes:**
Upon successful completion of the module the students will be able to:
1. Identify the problem (or model type) based on a problem specification given;
2. Solve given problems in each of the (sub)fields of study by hand and/or by utilizing available software;
3. Interpret/explain the solution to the problem (as for management);
4. Construct/develop a DSS based on a given Case Study (Project).

<th>Semester 2</th>
<th>NQF level: 6</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name: Introductory to Labour Law</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Module outcomes:**
Upon successful completion of this module students should be able to demonstrate the following:
- A detailed knowledge and understanding of the principles of Labour Law with specific reference to:
  1) what labour law entails, the different sources and the distinction between; individual and collective labour law;
  2) the nature and essentialia of a contract of employment;
  3) the rights and obligations of the employer and employee in an employment relationship; and the conclusion and termination of a contract of employment as well as remedies for breach of contract.
- Ability to select, evaluate and apply legal principles to solve fundamental problems in a defined environment in the field of Labour Law as well as an understanding of the ethical
implications of decisions, actions and practices specifically relevant to Labour Law and to represent the employment parties during dispute resolution processes. This will include discipline-specific methods and techniques of scientific enquiry and information gathering on subject-related topics from relevant sources, as well as analysing, evaluating and synthesising the information and providing conclusions to a given context in the field of Labour Law.

- Accurate and coherent written and verbal communication of principles, rules and solutions to problem-solving tasks or projects by means of preparing for a disciplinary hearing, conciliation, arbitration, the writing of legal opinions and written answers to evaluations with an understanding of and respect for intellectual property conventions, copyright and rules on plagiarism.
- Monitor own learning progress and apply relevant learning strategies and management of resources to successfully realise all learning outcomes of this module.

| Credits: | 12 |
| Assessment modes: | PC 3 hours 1:1 |
| Module code: | MEGI271 |
| Year module: | |
| NQF level: | 6 |
| Name: | Workshop Training |

**Module objective:**
The purpose of this module is to provide students instruction in workshop practice and the safe use of tools. Students must master the practical use of basic hand tools and manufacturing equipment and have acquired basic knowledge of safety requirements in the workshop and the skills to fabricate small articles. The eleven ELO’s of ECSA will also be introduced and discussed.

**Module outcomes:**
After successful completion of this module, students will have mastered the practical use of basic hand tools and manufacturing equipment, e.g. welding machines and various other machine tools. The student will acquire basic knowledge of engineering drawings, safety requirements in the workshop and the skills to fabricate small articles; involving plate metal work, turning, welding, electronics and they will acquire knowledge about electrical circuits and electrical equipment.

Knowledge
The student will able to understand workshop safety and the basic understanding of the various machines in the industry and the eleven ELO’s of ECSA.

Skills
After completion of this module, the student will have developed the following skills:
- Interpretation and layout of engineering drawings, manufacturing and job scheduling/planning;
- Understand the need of workshop safety;
- Ability to understand the hand tools and real life working experience;
- Ability to select material and do several jointing methods in the engineering environment;
- Fabricate small articles.

| Credits: | 8 |
| Prerequisite: | none |
| Method of delivery: | practical training – Participation. |
| Module code: | NUCI321 |
| Semester 2: | |
| NQF level: | 7 |
| Name: | Nuclear Energy |

**Module objective:**
Students are expected to develop knowledge and understanding of the opportunities and challenges facing the global nuclear energy industry and to gain basic techno-economic knowledge of the major power source types, in order to be able to select the most applicable technical and economical options, in view of these global energy policy issues. The attainment of these general outcomes will be facilitated by the more specific outcomes listed below.

**Module outcomes:**
After successful completion of this module, the student should have mastered the following:
Knowledge:
Acquire integrated knowledge of issues pertaining to global trends in the field of nuclear energy production and the global consequences thereof with an ability to apply and evaluate the key terms, concepts, facts, principles, rules and theories of the field;
acquire detailed knowledge of nuclear materials in the fuel cycle, and how this knowledge relates to other fields of energy supply;
develop understanding of a range of methods of enquiry in the field of nuclear energy systems, and an ability to apply a range of methods to resolve problems or introduce change;
Skills:
Students are expected to:
- develop skill and ability to identify, analyse, critically reflect on and address complex problems, applying evidence-based solutions and theory-driven arguments;
- develop an ability to take decisions and act ethically and professionally, and the ability to justify these decisions and actions drawing on appropriate ethical values and approaches, within a simulated group-work class environment;
- develop appropriate processes of information gathering for current technical and economic issues relating to nuclear power in a global context; and an ability to independently validate sources of information, and evaluate and manage the information;
- hone the ability to develop and communicate one's own ideas and opinions in well-formed arguments, using appropriate academic, professional, or occupational discourse;
- develop an ability to manage processes in unfamiliar and variable contexts, recognising that problem solving is context- and system bound, and does not occur in isolation;
- develop an ability to accurately identify, evaluate and address own learning needs in a self-directed manner, and facilitate collaborative learning processes; and
- take full responsibility for own work, decision making and use of resources and limited accountability for the decisions and actions of others in varied or ill-defined contexts.

Credits: 12
Prerequisite: none
Assessment modes: PC 3 hours 1:1
Module code: NUCI326 | Semester 2 | NQF level: 7

Name: Nuclear Engineering I

Module objective: To expand the students basic knowledge in atomic and nuclear physics and in nuclear engineering fields, about the interaction of radiation with matter, various nuclear power reactors and their fuel cycles, neutron moderation (slowing down) and diffusion in nuclear reactors, as well as introduce basic knowledge of reactor analysis and time dependent behaviour of nuclear reactors and thermal hydraulics of nuclear reactors.

Module outcomes:
After successful completion of this module, the student should have the following:
Knowledge:
- Basic knowledge in atomic and nuclear physics and in nuclear engineering fields;
- Nuclear physics and the interaction of radiation with matter;
- Various nuclear reactor types;
- Heat production and transfer in nuclear reactors;
- Radiation protection, radiation shielding, licensing, safety and environmental aspects of nuclear power;
Skills:
- Reveal, apply and expand basic knowledge in atomic and nuclear physics and in nuclear engineering fields;
- Apply basic knowledge about nuclear physics and the interaction of radiation with matter to the elementary analysis of various nuclear power reactors and their fuel cycles;
- Use his/her broad background knowledge regarding the various reactor types, to make recommendations about the most suitable reactor type for various needs;
- Perform basic analytical calculation of neutron moderation and diffusion in nuclear reactors;
- Perform introductory analysis of nuclear reactors and their time dependent behaviour;
- Apply knowledge of heat production and transfer in nuclear reactors to basic analysis of their safety;
Apply basic knowledge of radiation protection, radiation shielding, licensing, safety and environmental aspects of nuclear power towards improving nuclear safety;

Credits: 12
Prerequisite: NONE
Co-required: NUCI321
Assessment modes: PC 3 hours 1:1

### Module code: NUCI421 Semester 2 NQF level: 8

**Module objective:** To guide students in rounding off their introductory knowledge of nuclear engineering, acquired in NUCI321 and NUCI326 on a mostly conceptual level, by adding the complementary mathematical and technical knowledge and insight.

**Module outcomes:**
In order to pass this module, students must obtain an average of at least 50% during assessment of the following outcomes:

#### Knowledge
- **Atomic and Nuclear Physics:** Students must be able to derive the appropriate mathematical formulae and apply these to the necessary calculations regarding the nuclear reactions in a nuclear reactor.
- **Interactions between Radiation and Matter:** Definition of the concepts, derivation and interpretation of the mathematical formulae and application of data, especially those concerning the interactions between neutrons and the various materials in the core of the reactor.
- **Different Types of Nuclear Reactors:** Mathematical description of the fuel cycle in terms of the conversion ratio, isotopic breeding, fuel burn-up, etc. Students must also be able to explain the advantages and disadvantages of different reactor types in terms of the theory treated in this module.
- **Neutron Diffusion and Moderation:** To derive, apply and understand Fick’s law and the relevant diffusion equations.
- **Nuclear Reactor Theory:** To understand and apply the one group reactor equation, to derive the bare slab reactor equation and to understand the other reactor shapes. To give qualitative theoretical explanations of the various aspects of reactor design, for instance reflectors and the lumping of fuel.
- **Time Dependant Reactor Behaviour:** To define and demonstrate insight into the mathematical concepts, without having to derive the mathematical formulae. To give detailed qualitative theoretical explanations of the mechanisms and effects of the temperature and void reactivity coefficients, also for different fuels.
- **Radiation Protection:** To explain the importance of radiation protection and to demonstrate elementary knowledge of radiation dosimetry, statutory radiation dose limits and techniques for protecting against radiation.
- **Reactor Safety and Licensing:** To have elementary understanding of the most important radiation safety theories as well as of the licensing process.
- **Nuclear Reactor Accidents:** To understand and discuss the technical aspects of the accidents in terms of the above mentioned theoretical concepts.

#### Skills
The student will be capable of:
- Synthesising lessons from the history of nuclear power to gain insight into how to best utilize nuclear power;
- Revealing, applying and expanding basic knowledge in atomic and nuclear physics and in nuclear engineering fields;
- Applying basic knowledge about nuclear physics and the interaction of radiation with matter to the elementary analysis of various nuclear power reactors and their fuel cycles;
- Using his broad background knowledge regarding the various reactor types, to make recommendations about the most suitable reactor type for various needs;
- Basic analytical calculation of neutron moderation and diffusion in nuclear reactors;
- Introductory analysis of nuclear reactors and their time dependent behaviour;
- Applying knowledge of heat production and transfer in nuclear reactors to basic analysis of their safety;
• Communicating with the public about the benefits and potential risks associated with nuclear power; and
• Applying all these skills towards creating elementary conceptual solutions for reactor design issues.

Credits: 16
Prerequisite: NUCI321 and NUCI326
Assessment modes: PC 3 hours 1:1

Module code: NUCI479 Year module NQF level: 8

Name: Project in Nuclear Engineering

Module objective: To teach the student to execute a project with help from a study leader and to report it both orally and in writing. The project has both a theoretical and practical component, e.g. design and testing. The student is given an opportunity to integrate his/her knowledge and skills in various engineering subjects into one comprehensive project.

Module outcomes:
After successful completion of this module, the student should be able to
• define the problem and divide it into smaller problems;
• synthesize, analyse and evaluate the possible solutions;
• document the design or experimental procedures;
• fabricate the design or experimental hardware;
• test aspects of the design, evaluate the design or to do the experiments;
• collect information through the library and/or internet;
• report on the project both verbally and in writing; and
• use project.

Credits: 16
Prerequisite: INGM271
Student has to be in final year and must be able to complete degree.
Co-required: INGM472
Assessment modes: Successful reporting on an engineering project, in the form of a written report, an oral presentation and a poster presentation.

Module code: REII112 Semester 1 NQF level: 5

Name: Introduction to Digital Systems

Module outcomes:
To successfully complete this module, the student should demonstrate that he/she
• has acquired thorough knowledge of binary and octal number systems, logic gates, Boolean algebra and simplification, Karnaugh map simplification, gates and their time relationships, as well as knowledge of various combinational circuits, e.g. decoding and encoding and mathematical circuits, synchronous circuits, flip-flop circuits and their time characteristics, random circuit adder designs, time division multiplexing, A/D, D/A converters and coupling, memory systems and microcomputer structures, buses and time signals, codes, e.g. ASCII, Grey, EBCDIC; and
• is conversant with the theory of analysis, evaluation, simulation, design, synthesis and troubleshooting of logical circuits and systems of circuits.

Note: New module from 2017 previously EERI112.

Credits: 12
Prerequisite: none
Assessment modes: PC 3 hours 1:1

Module code: REII121 Semester 2 NQF level: 5

Name: Introduction to Microcontrollers

Module outcomes:
To successfully complete this module, the student should demonstrate that he/she
• has acquired thorough knowledge to identify and evaluate the difference between embedded microprocessors and general microprocessors as in the Intel 80x86 family, as well as the difference between von Neumann and Harvard architectures. Furthermore, the student should have the ability to specify and design embedded hardware for a given task and to
design and codify software for a given task in assembly language or C++;  
• can make use of IN and OUT interfaces on the level of specification, design and  
  programming and can develop software for both polled and interrupt driven systems;  
• can use address space optimally taking into consideration space and speed criteria in  
  microprocessors; and  
• is conversant with the theory of analysis, evaluation, simulation, design, synthesis and  
  troubleshooting of microprocessors on a systems level.

Note: New module from 2017 previously EERI123.

Credits: 12
Prerequisite: EERI112/REII111 and ITRW115
Assessment modes: PC 3 hours 1:1

Module code: REII211  Semester 1  NQF level: 6
Name: Algorithms and Optimisation

Module outcomes:
On successful completion of this module, students should be able to:
• demonstrate in-depth knowledge and understanding of mathematical modelling and the  
  ability to simulate mathematical models by using a programming language;  
• demonstrate knowledge and understanding of data structures (including vectors, matrices,  
  switched lists, stacks and queues);  
• use methods to create abstract data types for the above mentioned data structures;  
• demonstrate the ability to construct complex algorithms by setting up and manipulating the  
  above data structures;  
• solve different engineering problems by using the above techniques.

Note: New module from 2017 for Electrical, Electronic and Computer engineering students.  
Previous code EERI214.

Credits: 8
Prerequisite: ITRW115/ITRW126; WISN121; TGWN121
Co-required: WISN211, WISN212 and TGWN212
Assessment modes: PC 3 hours 1:1

Module code: REII222  Semester 2  NQF level: 6
Name: Embedded Systems

Module objective: This course is built on EERI122 (Computer Engineering II) by dealing with  
more advanced processors and their architectures. Students should be able to analyse and design  
embedded computer systems and solve problems in this domain.

Module outcomes:
To successfully complete this module, the student should demonstrate that he/she  
• has fundamental knowledge of 16- and 32-bit processor architectures;  
• understands electrical requirements of these processors and signal integrity issues to be  
  aware of;  
• understands memory interfaces. Specifically various types of RAM, ROM, FLASH. Address  
  decoding, and DMA is of importance;  
• understands common communication busses (I2C, I2S, RS232, RS485, USB, 1-Wire, SPI);  
• understands the challenges of programming for embedded systems. This specifically  
  pertains to the safety and security considerations when dealing with embedded systems;  
• can apply his/her knowledge to solve engineering problems by low level C programming of  
  embedded systems; and  
• can design a basic microcontroller based embedded system.

Note: New module from 2017 for Computer and Electronic engineering students. Previous code  
EERI214.

Credits: 16
Prerequisite: EERI112 and EERI123 or REII111 and REII121
Assessment modes: PC 3 hours 1:1

Note: New module from 2017 for Computer and Electronic engineering students. Previous code REII322.

Credits: 16
Prerequisite: REII221/REII222 and EERI316/REII313
Assessment modes: PC 3 hours 1:1

Module code: REII327  Semester 2  NQF level: 7

Name: Computer Engineering Design

Module objective: This module introduces the systems engineering process. A customised version of this process is applied to a complex engineering problem. Due to the scope and complexity of engineering problems, a high degree of teamwork is required.

Module outcomes:
To successfully complete this module, the student should demonstrate that he/she
• Understands the systems engineering process;
• Can apply design guidelines and constraints;
• Can interpret a development specification and the allocation of requirement;
• Apply a customised systems engineering process on a complex engineering project;
• Can successfully work as an individual and in groups;
• Use appropriate CAD, simulation and other relevant engineering software tools during the design process.

Credits: 16
Prerequisite: Student must be able to complete third year BEng
Assessment modes:
Functional demonstration of developed solution – Subminimum 50% (40%)
Design portfolio (40%)
Oral design presentation (20%)

Module code: REII414  Semester 1  NQF level: 8

Name: Databases and Web-programming

Module objective: This course introduces database concepts and web based programming.

Module outcomes:
To successfully complete this module, the student should be able to demonstrate that he/she:
• understands database definitions and terms;
• can design and implement databases, and store, alter and delete information in databases;
• Use basic and advanced SQL to manipulate databases;
• Identify problems associated with concurrent access and repair of databases after failure;
• can implement interfaces to the database;
• Understands the challenges of web based programming;
• Clearly understands the differences between procedural, object oriented and web programming;
• Successfully use software tools to implement web based software;
• Evaluate the applicability of rapid application development tools for developing web based software; and
• Is able to apply all of the above to solve an engineering problem.

Credits: 16
Prerequisite: EERI316/REII313; STTK312 and REII311/REII312
Assessment modes: PC 3 hours 1:1
## Module code: REII424  Semester 2  NQF level: 8

**Name:** Data Analysis

**Module objective:** This course serves as a capstone experience, which exposes the student to the integrated world of the real life computer engineering. Concepts that will be integrated include embedded systems, networking, databases and software engineering. In this module a complete end-to-end development of a sensor node is used as the primary vehicle of delivery.

**Module outcomes:**

To successfully complete this module, the student should be able to demonstrate that he/she:

- Estimate required sampling rate, data type and transmission rate of sensor data;
- Calculate the effect of multiple sensor nodes on network performance;
- Develop a database capable of handling multiple sensor nodes;
- Develop software for administration of the system;
- Apply applicable data mining principles to utilise acquired data;
- Understand the planning, documentation and testing of these types of systems;
- Apply of the above to a distributed sensing system.

**NOTE:** New module from 2017. Previous code REII423.

**Credits:** 16

**Prerequisite:** WISN227; EERI214/REII211; STTK312

**Assessment modes:** Exam 2 hours (40%) Capstone Project – Sub-minimum 50% (60%)

## Module code: STTK312  Semester 1  NQF level: 7

**Name:** Engineering Statistics

**Module outcomes:**

After successful completion of this module, the student shall be able to:

- Demonstrate fundamental knowledge of the following statistical concepts: uncertainty and variation, a distribution, certain continuous and discrete distributions, numerical summary measures, bivariate and multivariate data and distributions, methods for obtaining data, probability and sampling distributions, quality and reliability , point estimation and statistical intervals, testing statistical hypotheses, the analysis of variance, experimental design and inferential methods in regression and correlation.
- Demonstrate his/her ability to interpret graphic illustrations of the data, explain the concept of a distribution, work with certain continuous and discrete distributions, calculate measures of centre, spread and variants thereof, making scatter plots, calculating correlation coefficients, fitting lines to data and working with multivariate data, explaining different sampling methods and measurement systems, explain basic concepts in probability theory and the description of sampling distributions, explain methods used in quality and reliability, calculating point and interval estimates, performing hypothesis testing procedures, performing analysis of variance calculations, propose an experimental design in specific cases and using inferential methods in regression and correlation.

**Credits:** 16

**Prerequisite:** WISN121

**Assessment modes:** PC 3 hours 1:1

## Module code: TGWN121  Semester 2  NQF level: 5

**Name:** Statics and Mathematical Modelling

**Module outcomes:**

On completing this module, the students should be able to do the following: demonstrate fundamental knowledge of geometric vectors and their operational rules, vectors, forces, components, scalar and vector product, Cartesian forms, resultant of two- and three-dimensional systems of force through a point, the principle of propagation, moments, couples, reduction of systems of forces to a single force and a single couple, equilibrium in a plane and equilibrium in space, friction and moments rotating around axes, the modelling process, geometric similarity and proportionalities, dimensional analysis and the theorem of Buckingham; to demonstrate problem solving skills by analysing familiar and unfamiliar problems, by using knowledge of techniques to determine resultants of different types of systems of force, by solving equilibrium problems in two
and three dimensions, by forming and solving models by means of proportionality relations and dimensional analysis, and by fitting models to data.

<tbody>
<tr>
<td>Name: Dynamics I</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Module outcomes:** On completing this module, students should be able to do the following:
- demonstrate fundamental knowledge of kinematics (square, normal, tangential and cylindrical coordinates) and kinetics of a single particle (force, acceleration, work, energy, momentum, impulse), a system of particles (force, acceleration, work, energy, momentum, impulse) and a rigid body (force, acceleration, work, energy, momentum, impulse, moment of inertia, angular impulse and angular momentum), all moving along a straight line or a curved trajectory; demonstrate problem solving skills by analysing familiar and unfamiliar problems and using knowledge of kinematics and kinetics to calculate time duration, displacements, velocities, accelerations, forces, word done, energy, momentum, impulse, moment of inertia, angular impulse and angular momentum.

<td>Name: Differential Equations</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Module outcomes:**
On completing this module students should be able to do the following:
- demonstrate fundamental knowledge of ordinary differential equations and standard methods of solution amongst others separation of variables, variation of parameters and the Laplace transform;
- solve suitable unknown ordinary differential equations, initial value problems and systems using the standard methods above and elementary numerical algorithms utilizing MATLAB or other computer software; model real phenomena.

**NOTE:** Previously TGWN212.

<tr>
<td>Name: Numerical Analysis</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Module outcomes:**
On completing this module the student should be able to do the following:
- demonstrate fundamental knowledge and insight into the theory of basic numerical methods for general occurring mathematical problems, amongst which are the solving of non-linear equations, determining interpolation polynomials and the numerical D of definite integrals;
- Demonstrate problem solving skills by solving non-linear equations through iteration techniques, determining the interpolation polynomials of Lagrange and Newton, determining definite integrals by means of the trapezium method, Simpson’s rule, Romberg integration and Gauss quadrature, and the computer application of these techniques, and the methods of Heun and Runge Kutta for the solution of single or systems of differential equations, and be able to apply these techniques computationally;
- Show a fondness for this field of study and demonstrate insight into the relation between reality and abstraction, model and solution.

**NOTE:** Previously TGWN222.

<table>

<th>Semester 1</th>
<th>NQF level: 7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name: Partial Differential Equations (Numerical)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Module outcomes:**
On completing this module the student should be able to do the following: demonstrate fundamental knowledge and insight into the discretisation of ordinary and partial differential equations, the special properties of tridiagonal matrices, calculation problems caused by ill-
conditioned and sparse systems of linear equations, convergence properties of iterative methods of systems of linear equations, solving parabolic, elliptical and hyperbolic differential equations numerically, performing iterative methods with MATLAB on a computer; demonstrate problem solving skills in numerically solving two point boundary value problems, the heat equation, the potential equation and the wave equation with the finite difference methods and in implementing these by computer; show a fondness of this field of study and demonstrate insight into the relation between reality and abstraction, model and solution; reveal a Christian or alternative perspective on the subject.

Module code: TGWN321  Semester 2  NQF level: 7
Name: Dynamics III

Module outcomes:
On completing this module the student should be able to do the following: demonstrate fundamental knowledge and insight into the kinematics and kinetics of a rigid body in space, the Lagrange formulation for dynamics and the basis of variation calculus; demonstrate skills in solving problems describing motion and the constraints on motion, modelling the three-dimensional motion of a rigid body, stationary curves for functionals formed through integrals; show a fondness of this field of study and demonstrate insight into the relation between reality and abstraction, model and solution; reveal a Christian or alternative perspective on the subject.

Module code: TGWN322  Semester 2  NQF level: 7
Name: Optimisation

Module outcomes:
On completing this module, students should be able to do the following: demonstrate fundamental knowledge of analytical and numerical optimisation techniques for functions of one or more variables, including problems with restrictions on unevenness and evenness; demonstrate problem solving skills by applying a variety of mathematical optimisation techniques to familiar and unfamiliar unrestricted and restricted problems and implementing these techniques by computer with MATLAB as computer language.

Module code: WISN111  Semester 1  NQF level: 5
Title: Introductory Algebra and Analysis I

Module outcomes: On completing this module, students should be able to do the following: demonstrate fundamental knowledge of the concept of functions, polynomials in one variable with factor theorem, remainder theorem and synthetic division, rational functions and partial fractions, absolute value function, circle measure and inverse functions, trigonometric and inverse trigonometric functions, hyperbolic and inverse hyperbolic functions, exponential and logarithmic functions, limits, continuity, differentiability and indefinite integrals of all the above mentioned functions, complex numbers; demonstrate problem solving skills by analysing familiar and unfamiliar problems and implementing these techniques by computer using knowledge of derivatives and performing simple operations with complex numbers.

Module code: WISN121  Semester 2  NQF level: 5
Title: Introductory Algebra and Analysis II

Module outcomes: On completing this module, students should be able to do the following: demonstrate fundamental knowledge of logic, the system of real numbers, mathematical induction, permutations and combinations and the binomial theorem, De Moivre's theorem and its applications, L'Hopital's rule and its applications, the fundamental theorems of differential and integral calculus, the use of derivatives in optimisation and curve sketching, basic concepts of power series and the basic theorems on the converging of series, Taylor series, the basic properties and applications of the definite integral, applications of integration to surfaces, lengths and volumes; demonstrate problem solving skills by analysing familiar and unfamiliar problems, using knowledge of techniques by applying logic to systems of numbers, proving theorems with mathematical induction, determining the number of arrangements and selections from a set, performing operations with complex numbers, judging convergence of power series, calculating Taylor series, determining limits using L'Hopital's rule, sketching functions, formulating optimisation problems mathematically and using knowledge of derivatives to solve them, by determining definite integrals and calculating surfaces, lengths and volumes.
**Module code:** WISN211  |  **Semester 1**  |  **NQF level:** 6
--- | --- | ---
**Name:** Analysis III  

**Module outcomes:**  
On completing this module, students should be able to do the following: demonstrate a thorough knowledge and insight into all the aspects of the differential calculus of multivariate functions: partial and directional derivatives, the gradient function, optimisation problems, including Lagrange's method, the theory of multiple integrals to calculate partial derivatives, directional derivatives and gradients, and double and triple integrals; demonstrate problem solving skills by analysing familiar and unfamiliar problems, using knowledge of techniques to solve practical problems modelled with multivariate functions. Students should demonstrate the ability to use the geometric and physical meaning of the above-mentioned concepts to abstract the underlying mathematical structure of applied problems and to interpret the significance of the mathematical solution.

**Module code:** WISN212  |  **Semester 1**  |  **NQF level:** 6
--- | --- | ---
**Name:** Linear Algebra I  

**Module outcomes:**  
On completing this module students should be able to do the following: demonstrate a thorough knowledge and insight into the solvability of systems of linear equations; the basic properties of Euclidic spaces and linear transformations, interdependency of general vector space concepts; demonstrate the ability to determine Eigen values and Eigen vectors; demonstrate problem solving skills by analysing familiar and unfamiliar problems, using knowledge of techniques to solve systems of linear equations in the context of a vector space; to perform matrix operations; to determine bases for subspaces; to calculate Eigen values and Eigen vectors; to execute these matrix calculations and interpret the results.

**Module code:** WISN225  |  **Semester 2**  |  **NQF level:** 6
--- | --- | ---
**Name:** Engineering Analysis  

**Module outcomes:**  
On completing this module, students should be able to demonstrate advanced knowledge of and insight into the application of:  
- Vector fields, line integrals and the Fundamental Theorem of line integrals, Green’s theorem, oriented surfaces and surface integrals, rotation and divergence, the theorems of Stokes and Gauss.  
- Convergence criteria for sequences of real numbers and the monotone convergence principle, Convergence of series, standard convergence tests, absolute and conditional convergence, introduction to power series, Taylor’s theorem.  
- Definition of derivatives and contour integrals of complex functions, Laurent’s theorem (as an extension of Taylor’s theorem), algebraic manipulation of Laurent series, formal definition of the Z-transform and basic rules for Z-transforms, partial fraction method for computing inverse transforms, applications to difference equations.  

**NOTE:** Previous module WISN221.

**Module code:** WISN227  |  **Semester 2**  |  **NQF level:** 6
--- | --- | ---
**Name:** Applied Linear Algebra  

**Module outcomes:**  
On completion of this module the student should be able to:  
- demonstrate advanced knowledge of and insight into bases and linear independence of functions, and be able to use it in applications;  
- be able to use concepts like eigenvalues and eigenvectors in applications such as diagonalisation, discrete dynamical systems and systems of linear differential equations; be able to use the concepts of inner product, length and orthogonality to find orthogonal bases and master their applications such as for example the least squares method and linear models; symmetric matrices and further applications;  
- demonstrate problem-solving skills by analysing known and unknown problems and applications and applying the knowledge and techniques of linear algebra.

<td><strong>Module objective:</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The objective of this module is to develop an elementary knowledge and understanding of the foundational issues and/or ethical problems in one or both main subjects of the study programme, as is envisaged by the Institutional Plan. It is especially important to bring home the notion that, due to different assumptions and perspectives on the nature of reality, different answers to these questions have been developed, which represent different "approaches" in the subject field.

| **Module outcomes:** |
| After successful completion of this module, students should |
| • have a solid and systematic knowledge of the most important foundational issues in the relevant field of study and demonstrate a critical understanding of the meta-theoretical assumptions underscoring foundational issues; |
| • be able to demonstrate knowledge and a critical understanding of specific forms of ethics that apply to the field of study, such as a personalised code of conduct or the general human rights charter, and be able to apply such forms of ethics discriminatingly to analyse, evaluate and pose possible solutions to some current themes or issues salient to the field of study; and |
| • be able to demonstrate the ability to analyse, synthesise and critique the assumptions on which a chosen theme or issue is based, formulate a personal opinion about the theme or issue that gives evidence of a personal coherent world view, and communicate the findings in a presentation making use of applicable technology, as well as in an evidence-based report written in a typical academic format. |

| Credits: | 12 |
| Prerequisite: | None |
